12 **Abstract:** Indonesia's ranking is 72 out of 141 countries and is in 5th place in the group of countries
13 in Southeast Asia based on the 2019 Global Competitiveness Index (GCI) by the World Economic
14 Forum. The current development of infrastructure development is not directly proportional to an
15 increase in the number of infrastructure users by 1.9% from an annual increase of 10%-55%. And
16 the occurrence of implementation time experienced a delay of 11.95%. And with a low rate of
17 return on books with high investment costs in the construction of 7.79%. The expected goal in this
18 research is to have cost and time efficiency in implementing infrastructure development. In this
19 study, the focus is on the upper structure work, one of which is the box girder, to improve time and
20 cost efficiency based on the Manual Program Evaluation and Review Technique (M-PERT) and
21 Value Engineering (VE) in the case study of this research. The case study using the M-PERT
22 method resulted in a time efficiency value of 98.87% of the completion time at the job site, while the
23 VE method obtained an added value of income outside toll roads of 9.38% of construction costs.

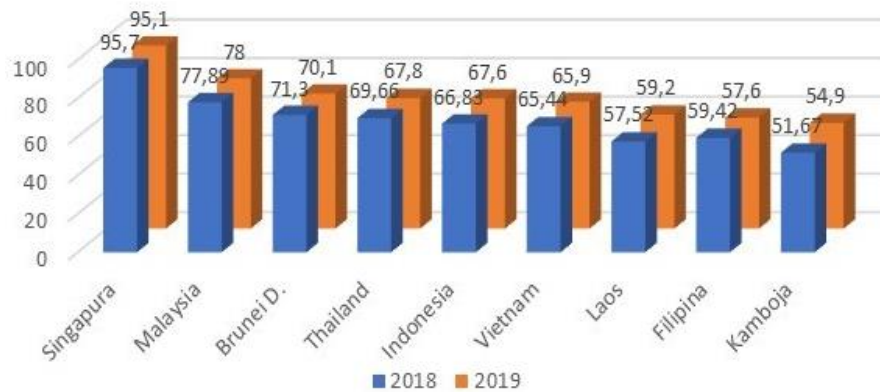

24 **Keywords:** highway; box girder; m-pert; value engineering; time and cost-efficiency

25 **1. Introduction**

26 Infrastructure development is the main target of government programs, as evidenced directly
27 by making infrastructure development one of the main strategic issues and targets or a general
28 infrastructure target that must be worked on. This development is the main target because
29 Indonesia's ranking is 72 out of a total of 141 countries with a competitiveness score at the 67.7 level
30 based on the World Economic Forum on the Global Competitiveness Index (GCI) activity in 2019
31 and is in 5th place in the Asian Region. Southeast (ASEAN).

32 The infrastructure sector, as one of the primary drivers in stimulating economic growth and
33 developing inclusivity in Indonesia, has been upgrading and equitably expanding throughout the
34 country to reduce logistics costs, reduce the gap between eastern and western Indonesia, increase
35 economic growth and also reduce poverty. Based on the Visium 2030 set by The Ministry of Public
36 Works and Housing, it is projected that the investment needs to meet the requirement for
37 infrastructure development in 2020-2024.

38 Based on the National Medium-Term Development Plan (RPJMN) 2020-2024 [2], the expected
39 target is to create an independent, advanced, just, and prosperous Indonesian society through
40 accelerating development in various fields by emphasizing the flying of a strong economic structure
41 based on competitive advantages in various regions. supported by quality and competitive human
42 resources. Of the targeted construction of new toll roads spanning 2,500 km spread over 78
43 development projects. Starting from the toll road works, more and more toll road projects are being
44 carried out, which are always part of each project, namely Cost, Quality (Performance), and Time.

45 **Figure 1.** ASEAN Country Infrastructure Competitiveness Ranking Score [1].

46 Also, it can increase Indonesia's economic competitiveness from the aspect of infrastructure
 47 development. Efficient and extensive infrastructure aims to ensure the effectiveness of the
 48 functioning of the economy. Infrastructure development is expected to increase accessibility,
 49 increase the competitiveness of a region, and integrate domestic and international markets with
 50 competitive costs in a timely manner [3]. In realizing this, it is in the development of infrastructure if
 51 transportation is smooth between one area and another, in the form of land, sea, and air
 52 transportation. At this time, toll road infrastructure constitutes an adequate land transportation
 53 infrastructure or serves for the movement of people or goods which is quite efficient in terms of
 54 travel time and distance. According to [4], the development of population growth causes a reduction
 55 in the road network caused by an increase in the number of vehicles which continues to increase
 56 every year, ranging from 10%-55% per year and is not balanced with the development of road length
 57 which is only around 1.9% per year.

58 With the plan for new toll roads in 2020-2024 almost 2 (two) times the plan for new toll roads in
 59 the 2015-2019 development planning, it is hoped that they will proceed according to the budgeted
 60 plan. In road works on the project, there are many theories that can be done, from data collected as
 61 many as 1,722 toll road projects taken from 1995 to 2001 by the Indiana Department of
 62 Transportation, the United States, which obtained 11.95% highway delays [5]. The high investment
 63 in toll road construction and the low rate of return on interest, which is only around 7.79%, makes it
 64 difficult to attract private investors to participate in infrastructure development [6]. With any
 65 problems or constraints faced in infrastructure development later, it is hoped that in its
 66 implementation, a solution is needed to overcome delays in both the construction and operation of
 67 the toll road. This researcher will analyze the scheduling time efficiency using the Manual Program
 68 Evaluation and Review Technique (M-PERT) which gets a job optimization of 7,55% from the initial
 69 work duration [7] and construction costs using Value Engineering (VE) which optimizes job
 70 financing by 8,32% [8].

71 The construction of toll roads is not much different from the construction of elevated roads, the
 72 difference is that there are no two-wheeled vehicles. Where the construction of the intersection is
 73 parallel to the construction of laying roads at a cost of around 175 million THB, to increase the
 74 capacity of the intersection and reduce vehicle delays and long queues, and the flyover is one that
 75 supports a traffic volume of around 25,000-45,000 vehicles/day [9].

76 In the construction of this infrastructure, in its implementation, handling is required that there
 77 is no delay in both the construction and operation of the toll road. In implementing a project, there
 78 are several risk factors and uncertainties experienced in the implementation process. However, in a
 79 toll road construction project, it must consider the objectives of the work where the implementation
 80 is a process that is repeated continuously with the same pattern so that it is necessary to optimize the
 81 implementation time and construction costs. In the implementation of construction, the biggest time
 82 and cost is on the structural work, both the upper and lower structures. In this study, the
 83 construction of the upper structure in the form of a box girder has the greatest influence on the
 84 overall construction implementation.

85 With this, it is expected that using the M-PERT and VE methods can optimize the construction
86 time and costs. The following are some of the assumptions or problem formulations in this study as
87 follows:

- 88 • How to implement the M-PERT and VE method to the work of box girder on toll road projects?
- 89 • What is the result of the implementation of M-PERT and VE on the study case of box girder
90 work on toll road projects?

91 **2. Materials and Methods**

92 The discussion of this research methodology will be conducted to analyze the implementation
93 and quality usually can be overcome with the application of the suitable technology and equipment,
94 while the aspect of work safety can be handled with the proper implementation of safety management
95 program especially in the field [10]. Implementation M-PERT and VE methods and their effects on
96 improving time and cost performance on box girder work on toll road projects, as well as identifying
97 the factors that most influence the success (critical success factor) of the implementation of the M-
98 method. PERT and VE in improving time and cost performance on box girder work on toll road
99 projects.

100 This research is formulated using a combination of two research methods, namely quantitative -
101 experimental methods and qualitative methods (with statistical analysis). Quantitative methods -
102 experiments are carried out by simulating the implementation of the M-PERT and VE methods on
103 the research object (or called the implementation case study), which is based on the implementation
104 procedure obtained from previous literature studies.

105 *2.1. Method of collecting data*

106 This study will use two (2) types of data, namely; primary data, which is obtained from
107 questionnaire surveys and focus group discussions as well as secondary data, which is obtained
108 from the results of literature studies such as books, references, journals, and other research related to
109 the research being carried out. The questionnaire survey was distributed to respondents through
110 distribution both offline.

111 *2.1.1. Questionnaire Survey*

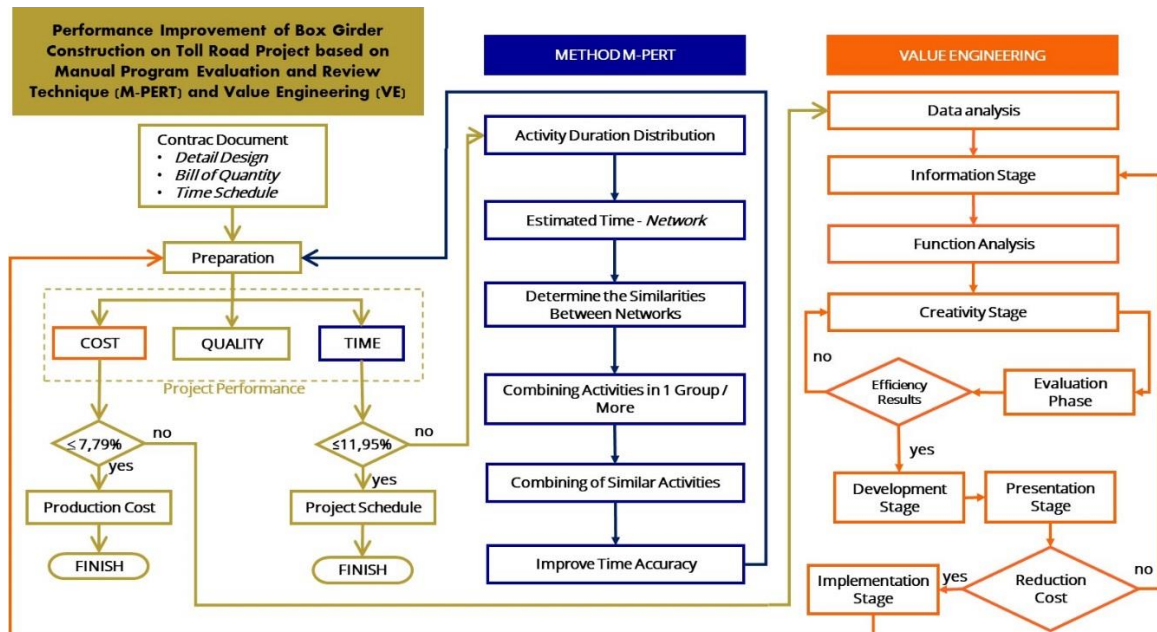

112 The purpose of this questionnaire survey is to obtain an overview of the stakeholders
113 perceptions of finishing work, namely project manager, site manager, or the equivalent of additional
114 functions, major risks, and key success factors in finishing high-rise buildings. This activity starts
115 with compiling the research variables into a draft questionnaire. The type of questionnaire that is
116 structured is a questionnaire in the form of closed-ended questions that already have a set of
117 answers that can be selected by the respondent. The answer model for this questionnaire is
118 Multiple-choice. Multiple-choice; It is used to find out the ranking of several things you want to
119 measure, in which there are several answer options and the respondent may choose one or more of
120 the available answer options.

121 *2.1.2. Data Tabulation*

122 Based on the data that has been collected from questionnaires distributed to respondents as
123 described in the previous section, tabulation of the data was carried out to facilitate the analysis
124 process. Data tabulation is intended for entering data from certain tables and arranging the numbers
125 and calculating them. There are two types of tables that are often used, namely data tables and work
126 tables. Data tables are tables that are used to describe data, making it easier for researchers to
127 understand the structure of the data. While the worktable is a table used to analyze the data
128 contained in the data table.
129

130 2.2. Analysis Method Implementation Manual Program Evaluation and Review Technique (M-PERT) dan
 131 Value Engineering (VE)

132 The analysis used follows the implementation flow as shown in Figure 2 for this
 133 implementation flowchart, as an effort to assess the improvement in time and cost performance
 134 based on M-PERT & VE on the research object.

135 **Figure 2.** Flowchart of the Implementation of Time and Cost Performance Improvement Based on
 136 M-PERT and VE

137 2.2.1. Manual Program Evaluation and Review Technique (M-PERT)

138 In this study, the method used in this study was the Manual Program Evaluation and Review
 139 Technique (M-PERT) method. In determining the success of a project, the stage of quality
 140 maintenance to remain at a predetermined standard, there needs to be supervision and emphasis on
 141 the sustainability of a construction project. These stages include:

- 142 • The planning stage needs a quality planning procedure (quality planning)
- 143 • The implementation phase needs quality assurance (quality assurance)
- 144 • The evaluation stage needs control of quality (quality control),
- 145 • Maintenance stage and quality development (quality Improvement)

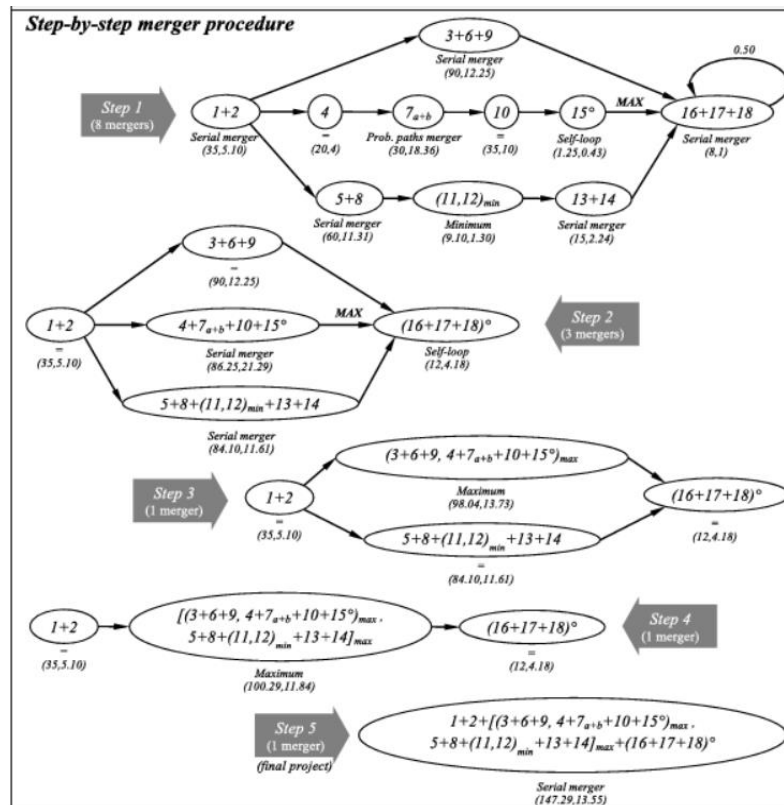

146 Emphasis on these four stages has been carried out on any construction project with the
 147 assumption that the better the quality, the higher the level of customer satisfaction (customers), and
 148 the return (major returns) to the capital invested in the project will be higher.

149 The M-PERT method was first introduced by Pablo Ballesteros Perez, Ph.D. published in the
 150 American Society of Civil Engineers (ASCE) in June 2017. In this journal, a case study analysis was
 151 carried out on bridgework using the PERT method, and a Manual Program Evaluation and Review
 152 Technique (M-PERT) was carried out. The aim was to update PERT and propose a new redefined
 153 technique named M-PERT, which deals with the most relevant weaknesses of the original technique
 154 (event incorporation bias), enables manual computation, and adds a new and interesting set of
 155 features that the original technique lacked. M-PERT allows modeling of much more representative
 156 real-life projects and helps to schedule students to understand more intuitively the basic concepts of
 157 scheduling when activities have uncertain duration [11].

158 Essentially, M-PERT recursively streamlines the schedule network by combining activities in
 159 series and parallels. M-PERT has been built on five models. Most of which share some specific traits
 160 (marked with an X). All five methods utilize the activity-on-arc (AoA) network, whereas M-PERT
 161 uses activity-on-node (AON) because it is more user friendly for practitioners and more commonly

162 found in software (e.g., Microsoft Project, Primavera Astrologers). M-PERT makes exclusive use of
 163 the AON network with a preferred finish-start (FS) link. Steps on the application of M-PERT in
 164 bridgework [11].

165 M-PERT is a reduction technique in which project activities are combined by groups of two or
 166 more, resulting in new single merger activity. The challenge of using M-PERT is how to precisely
 167 combine different activities (which ultimately correspond to a duration distribution). For that reason
 168 and justified earlier, it is assumed that the activity duration follows a normal distribution.
 169 Recognizing that certain probability distributions are almost insignificant, normal assumptions are
 170 also made by three of the five methods. CPM / PERT light network components show how
 171 interconnected one activity is with other activities in a project [11].

172 **Figure 3.** Activity Merger Steps [11].

173 This technique takes advantage of several methods proposed since the original PERT was
 174 introduced. In particular, in situations with multiple parallel paths (the norm in construction
 175 projects), the original PERT paid little attention to project duration and excessive variance. A
 176 systematic literature review has been prepared to justify M-PERT which concentrates on the
 177 significant weaknesses of PERT and to show why, regardless of other sinister aspects, the resulting
 178 tool is still accurate but uncomplicated. Indeed, the proposed method is easy to apply and easy to
 179 learn intuitive nature and simplifies assumptions. This makes M-PERT an attractive tool for teaching
 180 the basics of scheduling for construction and project management, especially since the calculations
 181 can be developed manually or in a very simple spreadsheet manner [11]. Based on [12] the steel
 182 construction project in the case study 63 days of project planning time. Calculated with PERT or a
 183 critical path of 69.3 days. And Actual length of work 66 days. It means a difference of 3.3 days
 184 compared to the actual time on-site or has accurate 95,24%. Calculations are based on MPERT 66.74
 185 days. It means a difference of 0.74 days compared to the actual time on-site or has an accurate
 186 98.89%.

187 **Figure 4.** Comparison of the accuracy of project duration estimates between the normal, PERT, and
 188 M-PERT distributions [11].

189 2.2.2. Value Engineering (VE)

190 Value Engineering was introduced in Indonesia in 1986 by Dr. Ir. Suriana Chandra. After the
 191 introduction of value engineering in the building construction industry in Indonesia for more than
 192 30 years, it has not shown any encouraging development. This does not only happen in Indonesia,
 193 but the application of value engineering in the world of building construction in Southeast Asia has
 194 not developed properly.

195 Value Engineering or value engineering in this research is used to identify additional functions
 196 as innovation so that it can form an alternative conceptual design model that leads to an increase in
 197 the economic value added to infrastructure projects. In a brief description of the development of
 198 value engineering published in the standard book SAVE International [13], it is implied that the
 199 philosophy of value engineering makes it easy for efforts to understand the concept of value
 200 engineering, there are stages/phases in planning Value Engineering activities, namely: 1) the
 201 information gathering stage, 2) the function analysis stage, 3) the creativity and innovation stage, 4)
 202 the development stage, 5) the decision analysis stage, 6) the decision-making stage, 7) the
 203 implementation stage, 8) the recommendation stage, 9) the results research.

204 According to SAVE International, value engineering is not just about analyzing costs, but
 205 means that value engineering is:

- 206 • System oriented (System Oriented) formal work plan to identify and eliminate unnecessary
 207 costs (Unnecessary Cost).
- 208 • Multidisciplinary group approach (Multidisciplinary Team Approach) consisting of
 209 experienced planners and value engineering consultants.
- 210 • Life Cycle Oriented calculates the total costs over the life cycle of the project including the total
 211 costs to own and operate the facility.
- 212 • A proven management technique (A Proven Management Technique).
- 213 • Functional orientation (Function Oriented) relates the desired functions to the values received

214 The relationship between value, cost, and function according to [14] is a value that cannot be
 215 determined only by considering the subject itself, therefore the team must first determine a value
 216 measurement tool [15]. The performance of each component should be measured with this
 217 measuring instrument. According to the standard SAVE [13] the main concept of value engineering
 218 methodology lies in value (value). Value (value) is a statement of the relationship between functions
 219 and resources. In general, the value is described as follows [15].

$$Value = \frac{Function}{Cost} \quad (1)$$

220 Where the function is measured by the performance required by the customer and the resource
 221 is measured in the amount of material, labor, price, time, and others needed to complete the
 222 function. states that the main concept of the value engineering method lies in the value, function,
 223 and cost where the relationship is formulated as follows. [16] states that the main concept of the VE
 224 methodology lies in the value, function, and cost where the relationship is formulated in the
 225 following equation:

$$Value = \frac{Function + Quality}{Cost} \quad (2)$$

226 The benefits of the value engineering program have resulted in various improvements to the
 227 project/system/product and the achievement of values that have been widely used in developed
 228 countries and produced extraordinary effects (In-Chi-Sung, 2009). Major improvements have been
 229 achieved in return on project capital investment of 50% in construction projects in the UK
 230 (www.ivm.org.uk) as well as savings on public project costs of up to 25% of the total cost of large
 231 projects in the United States (www.value-eng.org).

232 The value engineering process is called a value engineering study, which is a sequence of
 233 activities in the value study carried out for an object (project, process, product) which includes
 234 defining functions, developing and evaluating ideas that will produce a value engineering proposal
 235 and is held in the form of a workshop [17]. This value engineering study to conduct value
 236 engineering studies according to SAVE 2007 is divided into 3 levels as follows: 1) Pre-Study Stage
 237 (Pre-Workshop Study), 2) Study Stage (Value Job Plan), and 3) Post-Study Stage (Post Workshop
 238 Study). In value engineering, all ideas can be compared based on LCC, the value of all alternatives is
 239 defined to produce the same basic function or set of functions. The cost elements calculated include:

- 240 • Initial costs consisting of: building costs (item cost); development costs (development cost);
- 241 implementation cost (implementation cost); miscellaneous costs.
- 242 • Annual Recurring Costs consist of operational costs.

243 3. Results

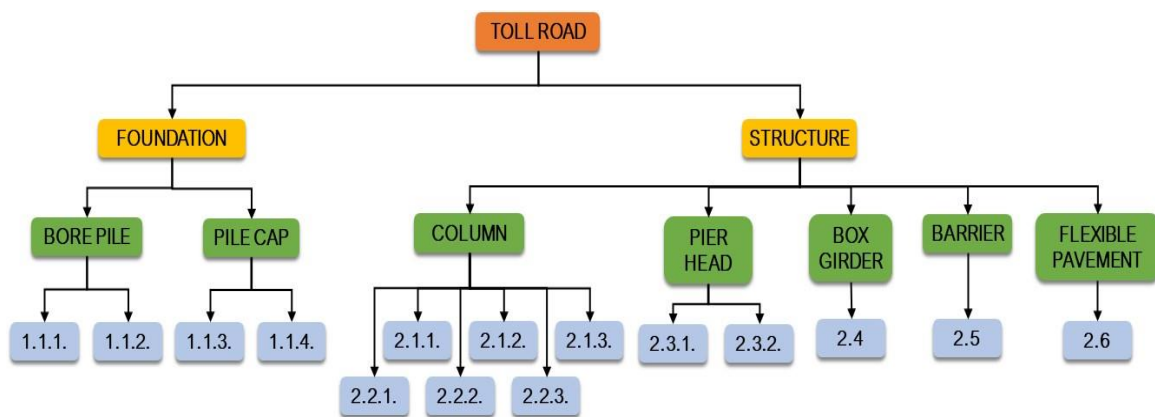

244 The research used for the validation of the case study was the Construction of Bekasi - Cawang -
 245 Kampung Melayu Toll Road Works Section 1: STA 1 + 011 - STA 11 + 501 which is located on a
 246 national road that connects Bekasi City in West Java Province with the City of Jakarta, capable again
 247 and not in balance with the development and volume growth of vehicles passing the road, resulting
 248 in frequent congestion and disrupting the distribution of people and goods. For this reason, the
 249 construction of the Becakayu Toll Road is one solution so that congestion that occurs in the
 250 connecting areas between these areas can be resolved. This study is limited to the construction stage
 251 from the perspective of consultants and contractors on the work of the upper structure of the box
 252 girder section. Where these research activities are generally carried out at the beginning of the
 253 project before starting even during the planning process so that the benefits can be felt to the
 254 stakeholders.

255 3.1. Manual Program Evaluation and Review Technique (M-PERT)

256 In this section, the author discusses the determination of the planning duration of the Bekasi -
 257 Cawang - Kampung Melayu Toll Road Development project, especially in the pier to pier segment
 258 including the box girder using the M-PERT method which begins with making the project duration
 259 first. Planning the project duration starts with determining the duration of each activity in the work
 260 until finally determining the total project duration and its standard deviation. To solve this case
 261 study, what is done is making a network diagram for the activities carried out from the beginning to
 262 the last activity. The network diagram for the construction of the Bekasi - Cawang - Kampung
 263 Melayu toll road is divided into 2 main parts, namely (1) foundation work, and (2) structural work.
 264 The following are the stages of work items from the beginning to the end of the activities for
 265 foundation work and the following toll road construction structure works.

266 The explanation for the job description in Figure 5 is in Table 1. With the creation of a
 267 predecessor network for the construction of the toll road. PERT is a time-oriented method that leads
 268 to probabilistic or probabilistic scheduling [18]. Also in this vein, some research has been connected
 269 to the crashing of PERT activities in order to fast-track project execution [19]. This method is a
 270 development of the PERT method, which was developed by Pablo Ballesteros-Perez, Ph.D. a lecturer
 271 at the School of Construction Management and Engineering, University of Reading, UK. This
 272 method was introduced in 2017 with the ability to optimize the duration of the project up to 8.8%
 273 with a bridge project [11]. At the following stages:

- 274 • Making a detailed schedule or schedule of stages of detailed work implementation.
 275 • Calculation of the duration of each stage of work implementation.
 276 • Schedule creation and project scheduling analysis.
 277 • Merging stages of work implementation.

278 **Figure 5.** Bekasi - Cawang - Kampung Melayu Toll Road Construction Work Activities

279

Table 1. Activities Stage

Activity Code	Activity Description
1.1.1	Bore Pile Pier Work 1
1.1.2	Bore Pile Pier Work 2
1.1.3	Pile Cap Pier Works 1
1.1.4	Pile Cap Pier Works 2
2.1.1	Pier 1 Column Work Phase 1
2.1.2	Pier 1 Column Work Phase 2
2.1.3	Pier 1 Column Work Phase 3
2.2.1	Pier 2 Column Work Phase 1
2.2.2	Pier 2 Column Work Phase 2
2.2.3	Pier 2 Column Work Phase 3
2.3.1	Pier Head Work 1
2.3.2	Pier Head Work 2
2.4	Box Girder Jobs
2.5	Barrier Work
2.6	Flexible Pavement Work

280 Here is the network which is the critical path because all activities have zero slack. The duration
 281 for the PERT network was obtained for 209 days with a standard deviation of 64.21 days in Figure 6.

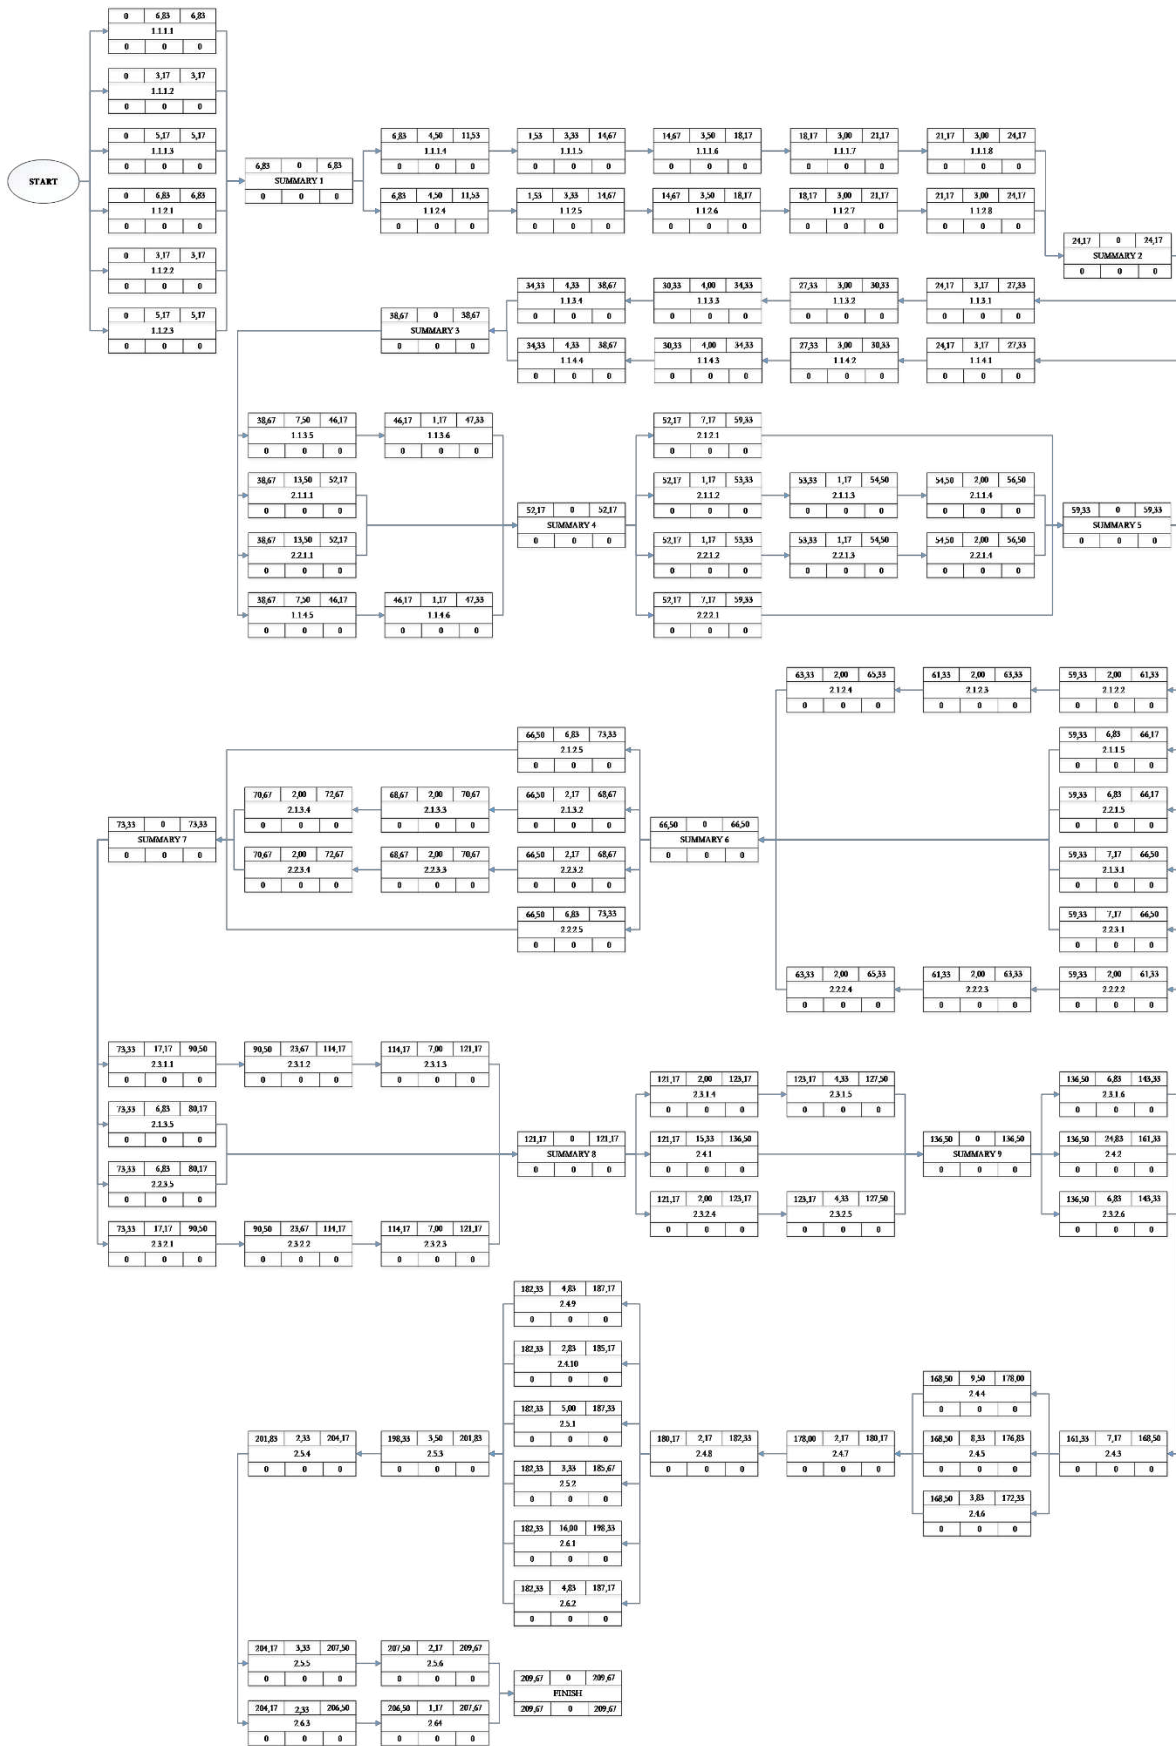

Figure 6. Precedence Diagramming Method

283 After determining the implementation time based on the PERT method, it is continued by using
 284 the M-PERT method by starting the calculation of the duration of work balancing the estimated time
 285 between pessimistic time, moderate time, optimistic time to get the expected time with the following
 286 equation:

$$t_e = \frac{t_o + (4 \times t_m) + t_p}{6} \tag{3}$$

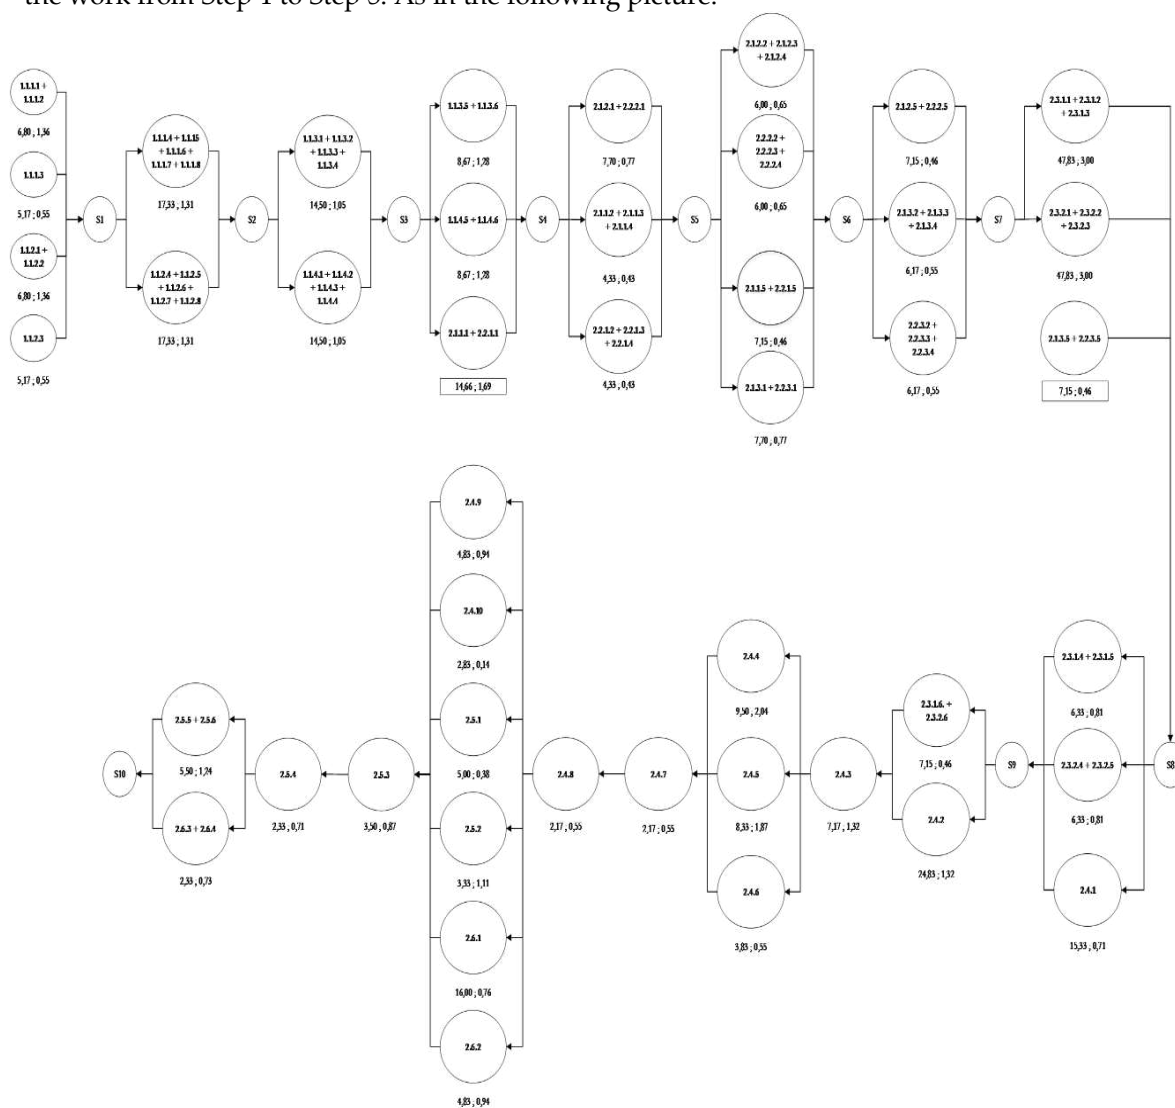

287 With a variation of each activity with the following equation:

$$V = \left(\frac{t_p - t_o}{6} \right)^2 \tag{4}$$

288 The calculation of the correction rate for solving the standard deviation is corrected by the
 289 following equation:

$$K = \sqrt{\frac{5}{7} + \left(\frac{16}{7} \times \frac{(t_m - t_o)(t_p - t_m)}{(t_p - t_o)^2} \right)} \tag{5}$$

290 By using the equation above, it is obtained a simplification from the PERT diagram followed by
 291 using M-PERT which is based on the equation issued or applied by the discoverer [11]. obtained as
 292 many as 5 steps for the implementation of the toll road construction. The following is a diagram of
 293 the work from Step 1 to Step 5. As in the following picture.

294 **Figure 7.** Diagram M-PERT Step 1

$$\begin{aligned}

295 **Figure 8.** Diagram M-PERT Step 5

296 With the equations and stages of using this method, the final results or summaries for job
 297 scheduling using the M-PERT method are obtained as listed in table 3.

298 **Table 2.** Result Metode M-PERT

Activity	Project Schedule (day)	M-PERT (day)	Realization (day)
Step 1		212,16	
Step 2		215,92	
Step 3	209	216,50	219
Step 4		216,52	
Step 5		216,52	

299 And the results of the analysis carried out in this study showed that the accuracy of the job
 300 execution schedule was 3.5 days or 1.13% of the 219 days of toll road construction work.

301 3.2. Value Engineering (VE)

302 The goal of this research is to acquire any work items that are viable to be value-engineered [20].
 303 In some countries, it is 50% -50% this kind of practice encourages contractors to implement VE
 304 during construction. The goal of this research is to acquire any work items that are viable to be
 305 value-engineering [21]. Construction projects are explained, and by covering
 306 Bregana-Zagreb-Dubrovnik Motorway construction in Croatia by BECHTEL - ENKA joint venture
 307 as the sample project, practices of VE in this project are described. The satisfactory results of time
 308 and cost-saving are achieved by applying value engineering principles through the VE team during
 309 the project preparation phase and project revision phase.

310 Approximately \$ 43,000,000 and 12 months of time were saved in total thanks to all these VE
 311 works. This saving provided a builder company with 6% financial saving and 17% work time
 312 reduction [22]. And from a previous study [3] with a bridge object using an additional function is
 313 obtained the total revenues for the SSB project with the transportation function only or the
 314 "Do-Nothing" scenario is estimated to be US\$8,495.58 Million. The total revenues for the SSB project
 315 with additional functions or the "Do-Something" scenario is estimated to be US\$ 61,529.02 Million.
 316 The lifecycle cost analysis using the IRR and NPV approach confirms that the development of the
 317 SSB project with additional functions increases the Internal Rate of Return for the whole project by
 318 7.56% that would provide a positive NPV value. So it can be ascertained that the financial viability of
 319 the SSB project would increase with additional functionality innovation.

320 Following is also a previous study on high rise building work on retaining wall work items
 321 using the Value Engineering increased performance at the failure by the cost with savings of 18.83%
 322 [23].

323 The phase begins by determining the scope of the problem from the VE study then continues by
 324 identifying the functions of the Bekasi - Cawang - Kampung Melayu Toll Road Development based
 325 on the conditions of the existing design concept, including:

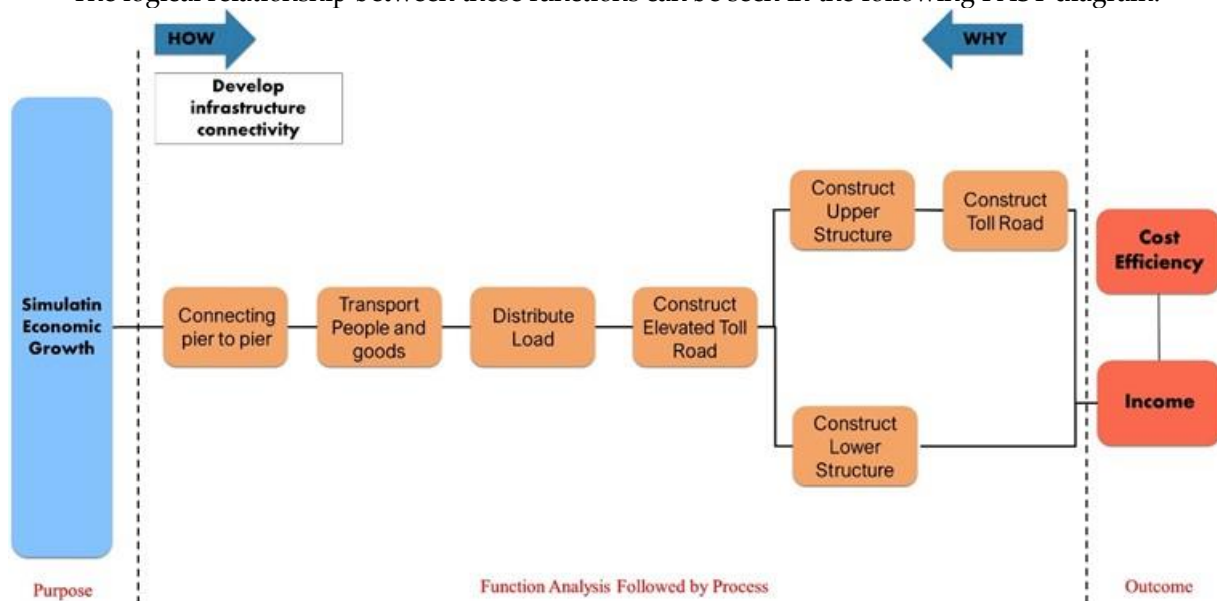

- 326 • Scope of the problem under study: Bekasi - Cawang - Kampung Melayu Toll Road
 327 Development Project for infrastructure in a highly vehicle-intensive area.
- 328 • Highest order function: stimulate economic growth in Bekasi - Cawang - Kampung.
- 329 • Lowest order function: generate income.
- 330 • Design objective: build connectivity infrastructure.
- 331 • Basic function: reduce congestion in Bekasi-Cawang-Kampung Melayu
- 332 • Defendant function: toll road components move people and goods, road structural components
 333 distribute loads.
- 334 • Processes: building roads, building foundations, building superstructures.

335 In this evaluation phase, it describes the main risk mitigation and the calculation of life cycle
 336 costs as a tool to evaluate the addition of the identified functions and explains how the mining
 337 function can add value to its function.

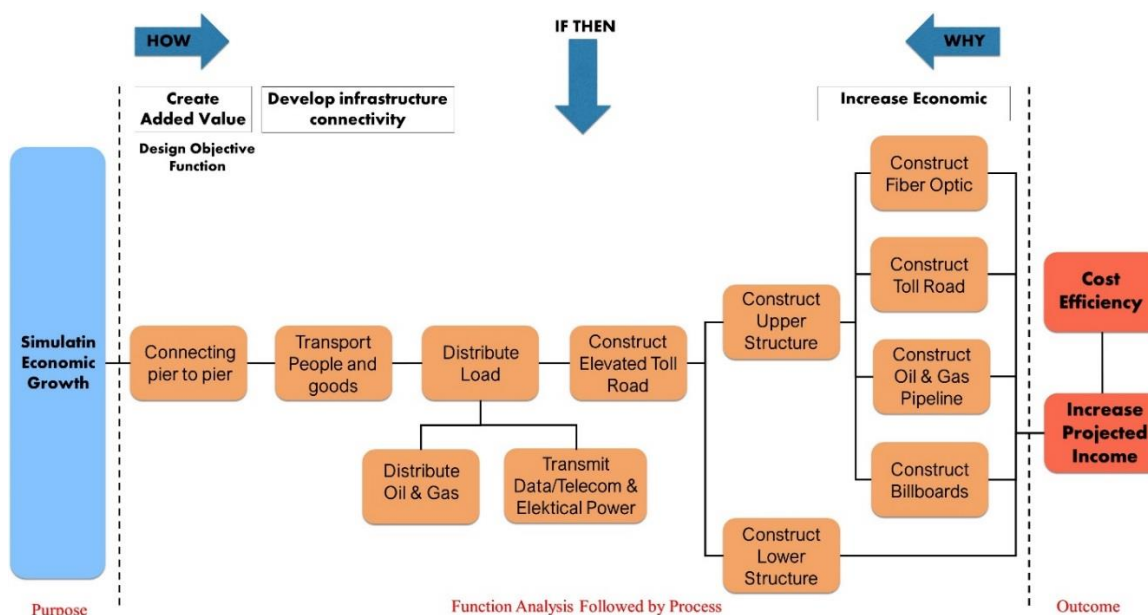

338 Creativity in this research is directed at developing functions that are integrated with their basic
 339 functions, by looking at all the potential that exists in the toll road development area, here are the
 340 results in the creativity phase, namely the potential for infrastructure efficiency with the idea of
 341 building oil pipes, gas pipes, fiber optics, and billboards. The results of this creativity become the
 342 material for making FAST Diagrams from the analysis of functions with the addition of Figure 9:

- 343 • Supporting functions: oil and gas distribution, transmitting data/telecommunication, installing
 344 billboards
- 345 • Supporting Processes: oil and gas development, fiber optic development, billboards
 346 construction.

347 The logical relationship between these functions can be seen in the following FAST diagram:

348 **Figure 9.** FAST Diagram of the Existing of the Bekasi - Cawang - Kampung Melayu Toll Road

349 **Figure 10.** FAST Diagram of the Development of the Bekasi - Cawang - Kampung Melayu Toll Road

350 With the addition of functions on the toll road box girder, namely the addition of oil pipework,
 351 gas pipeline, fiber optic work, digital work (led boards). From these additions, the amount or value
 352 of the addition can be obtained from several literature and brochures and the lifetime for each
 353 additional function. The lifetime of work as follows:

354 **Table 3.** Lifetime Addition of Function

Addition of Function	Time (years)
Oil Pipe	15
Gas Pipe	15
Fiber Optic Cables	30
Led	12

355 Based on Figure 9 and Table 3, from each additional function work, the development value or
 356 initial cost for each addition is obtained. From the calculation of the development financial analysis
 357 of the addition of functions, the NPV value, IRR value, and BCR value are obtained, as follows:

358 **Table 4.** Value-Added Cost of Functions

Item	Initial Cost (million rupiah)	NPV (million rupiah)	IRR	BCR
Oil and Gas	1.570.603	8.149.280	27,77%	4,6
Fiber Optic	4.950	13.081	18,96%	7
Billboard	1.315	9.210	19,96%	15

359 With this addition, the contribution of revenues outside the toll road was 9.83% of the toll road
 360 construction costs.

361 4. Discussion

362 With the results of using the M-PERT and VE methods in this study, it is hoped that the
 363 implementation time of infrastructure development in the future can be carried out according to the
 364 planned time and in financing this development, additional functions can be used in the
 365 infrastructure development so that the income and return of development capital are not fixed from

366 the toll road revenue is instead assisted by contributions other than toll roads. With this time and
 367 cost efficiency, it does not depend too much on government funding. These results can be used as a
 368 basis or can be applied to infrastructure development that has not yet been built so that in the future
 369 each toll road business entity can calculate income other than those toll road users.

370 5. Conclusions

371 Based on the results of the research that has been done, it can be concluded that the results of
 372 the Research Question are as follows:

- 373 • Factors affecting the Manual Program Evaluation and Review Technique (M-PERT) and the
 374 Value Engineering (VE) method respectively are Image Documents, Work Time, Work Value,
 375 Percentage of Delays, Network Simplification, Combined Activities, Number of Network
 376 Benchmarks / Number of Activities, Good Planning, Value Engineering Development, and Cost
 377 Efficiency.
- 378 • From the research results, it was found that the percentage of M-PERT towards project
 379 scheduling was 1.13% with an accuracy of 98.87% and the implementation of VE obtained a
 380 contribution of revenues outside toll roads of 9.83% of the toll road construction costs.
- 381 • This hypothesis has been proven by statistical analysis and case study analysis by taking the
 382 research object on Toll Road Buildings.

383 **Author Contributions:** Conceptualization, A.E.H. dan D.I.R.; data curation, D.I.R. dan M.M.; writing-review
 384 and editing, D.I.R. dan M.M. All authors have read and agreed to the published version of the manuscript.

385 **Funding:** This research received no external funding.

386 **Availability of data and materials:** Not applicable

387 **Acknowledgments:** This research was supported by research grants from Mercu Buana University. It is
 388 necessary to have standardized research that formed equivalent perceptions among all parties involved in the
 389 construction process, particularly to toll road projects. This is to improve the schedule, and costs effectiveness,
 390 and accuracy of the project, so that the performance of structure works of toll road projects can be enhanced.
 391 Understandably, further research on the effect of the implementation of the M-PERT and VE method to the
 392 monitoring of the toll projects is crucial. Further research on the implementation of the M-PERT and VE method
 393 on other projects should also be conducted to support the conclusion of this study.

394 **Conflicts of Interest:** The authors declare no conflict of interest
