27 **Abstract**

28 **Background**

29 Hypoxia is an extremely common adverse event occurring during a sedated  
30 gastrointestinal endoscopy procedure, especially in elderly patients, because  
31 of the limited reservation. Prolonged or severe hypoxia can cause ischemia of  
32 coronary artery, permanent nervous system damage, or even result in death.  
33 Hence, it is extremely important to reduce or prevent hypoxia during sedated  
34 gastrointestinal endoscopy in elderly patients. Although several oxygen  
35 methods would reduce hypoxia during this procedure, early detection of  
36 respiratory depression and early administration of intervention would be the  
37 best method to reduce or even confirm the hypoxia. Capnographic monitoring  
38 is found to be more sensitive to respiratory depression in patients before the  
39 onset of hypoxia than the current clinical routine monitoring of pulse oxygen  
40 saturation (SpO<sub>2</sub>); however, there exists a controversy regarding its effect.  
41 Therefore, this study was designed to improve the security of sedated  
42 gastrointestinal endoscopy in elderly patients.

43 **Methods:** A multicenter, randomized, single-blind, two-arm parallel-group,  
44 controlled with active comparator, interventional clinical trial will be conducted  
45 to evaluate the impact of an intervention based on additional capnographic  
46 monitoring on the incidence of hypoxia in elderly patients. Patients (n = 1800)  
47 scheduled for gastrointestinal endoscopy with propofol sedation will be

48 randomly assigned to either a control arm with standard monitoring or an  
49 interventional arm in which additional capnographic monitoring is available.

50 **Discussion:** This research project is primarily intended to examine whether an  
51 intervention based on additional capnographic monitoring would reduce the  
52 incidence of hypoxia in elderly patients during propofol and sufentanil sedation  
53 for gastrointestinal endoscopy. The results of this study may have a extensive  
54 impact on sedated gastrointestinal endoscopy practice and the development of  
55 guidelines.

56 **Trial registration:** ClinicalTrials.gov, NCT05030870. Registered on  
57 September 1, 2021.

68

69 **Introduction**

70 **Background and rationale{6a}**

71 The sedation rate of gastrointestinal endoscopy varies in different countries. In  
72 China, the overall sedation rate was only approximately 50%[1], whereas in  
73 the United States, >98% of gastrointestinal endoscopy procedures are  
74 sedated[2,3]. Cardiopulmonary complications, especially hypoxia, are most  
75 common during sedated gastrointestinal endoscopy. Prolonged or severe  
76 hypoxia can cause ischemia of coronary artery, permanent nervous system  
77 damage, or even result in death[4,5], and hence, determining a method to  
78 reduce the incidence of hypoxia has become a vital problem in the field of  
79 sedated gastrointestinal endoscopy.

80 Compared with the current clinical routine monitoring of pulse oxygen  
81 saturation (SpO<sub>2</sub>), capnographic monitoring can detect hypoventilation and  
82 respiratory depression earlier, which could help in providing earlier  
83 intervention[6]. Therefore, it is believed that capnographic monitoring would  
84 reduce the incidence of hypoxia. Nevertheless, a controversy exists regarding  
85 whether capnographic monitoring should be routinely performed during the  
86 sedated gastrointestinal endoscopy procedure.

87 In this regard, there are two major investigations, but a discrepancy was noted  
88 in their results. The first investigation, which was a randomized, controlled  
89 study (ColoCap Study) conducted by Beltz et al., confirmed that additional  
90 capnographic monitoring of ventilatory activity in ASA I–III patients reduces the  
91 incidence of hypoxia during propofol sedation for colonoscopy[7]. However, the  
92 second investigation, which was a cohort study, demonstrated that the addition  
93 of capnographic monitoring did not improve safety or patient satisfaction, but it  
94 did increase the cost[8]. The fundamental problem was that the initial oxygen  
95 flow in the ColoCap Study was only 2 L/min, which is not consistent with  
96 clinical practice, wherein it is generally 3–4 L/min. This inconsistency resulted  
97 in an incidence of hypoxia of >50% in the controlled group. Another limitation  
98 of the ColoCap Study was that the depth of sedation between the two groups  
99 may have been inconsistent. Although the cohort study was designed closer to  
100 clinical practice, it did not yield positive results. These conflicting results  
101 suggest that there is insufficient evidence for routine capnographic monitoring  
102 in all patients.

103 The elderly patients comprise a vulnerable group and are more susceptible to  
104 hypoxia during gastrointestinal endoscopy performed under drug  
105 sedation[9,10]. However, whether this vulnerable group needs to be routinely  
106 monitored for capnography has not been investigated. Therefore, this study  
107 was designed to improve the security of sedated gastrointestinal endoscopy in  
108 elderly patients.

109

110 **Objectives {7}**

111 Our aim is to investigate whether an intervention based on additional  
112 capnographic monitoring would reduce the incidence of hypoxia in elderly  
113 patients undergoing sedated gastrointestinal endoscopy. Our primary objective  
114 is to measure the incidence of hypoxia ( $75\% \leq \text{SpO}_2 < 90\%$  for  $< 60$  s). Our  
115 secondary objective is to measure the incidence of subclinical respiratory  
116 depression ( $90\% \leq \text{SpO}_2 < 95\%$ ), the incidence of severe hypoxia ( $\text{SpO}_2 <$   
117  $75\%$  or  $75\% \leq \text{SpO}_2 < 90\%$  for  $\geq 60$  s), the incidence of capnography curve  
118 decreased by half or more than the baseline and even disappeared without  
119 hypoxia ( $\text{SpO}_2 > 90\%$ ), and the incidence of other adverse events recorded by  
120 tools proposed by the World Society of Intravenous Anesthesia International  
121 Sedation Task Force. We predict that additional capnographic monitoring of  
122 ventilatory activity would reduce the incidence of hypoxia during propofol  
123 sedation for gastrointestinal endoscopy in elderly patients. Our aim is to  
124 provide credible evidence of a reduction in the incidence of hypoxia in elderly  
125 patients.

126

127 **Trial design {8}**

128 Our study is a multicenter, randomized, single-blind, two-arm parallel-group,  
129 controlled with active comparator, interventional clinical trial. We intend to

130 evaluate the impact of an intervention based on additional capnographic  
131 monitoring on the incidence of hypoxia in elderly patients.

132 This trial was conducted under the recommendations of the Standard Protocol  
133 Items: Recommendations for Interventional Trials (SPIRIT) (supplemental file,  
134 SPIRIT checklist). On September 1, 2021, the trial was registered on  
135 ClinicalTrials.gov (No. NCT05030870). We presented the trial registration data  
136 in the form of supplemental data.

137

## 138 **Methods: Participants, interventions, and outcomes**

### 139 **Study setting {9}**

140 Approximately 1800 participants will be enrolled in this study from the Renji  
141 Hospital Shanghai Jiao Tong University School of Medicine, Henan Provincial  
142 People's Hospital, and Qilu Hospital of Shandong University. The ethics  
143 committee of the Renji Hospital Shanghai Jiao Tong University School of  
144 Medicine approved and supported this clinical trial (KY-2021014).

145

### 146 **Eligibility criteria {10}**

147 This clinical trial has three centers recruited patients. A summary of the  
148 inclusion and exclusion criteria is presented in Table 1.

149

### 150 **Who will take informed consent? {26a}**

151 Potential participants will be explained this trial in detail by trained  
152 anesthesiologists and will be provided the informed consent form. After take  
153 enough time to deliberate, participants can decide whether they wish to  
154 participate in the trial. Then the participant or his/her trustee or guardian sign  
155 the informed consent form, and they can withdraw at any time during the trial.  
156 We collected baseline data from patients and randomize allocation using the  
157 central random system. Furthermore, participants can contact our team if they  
158 have any health concerns during the trial. The entire process of recruitment  
159 and consenting of study participants by members of the research team will be  
160 consistent with good clinical practice (GCP). If any serious adverse events  
161 occurs during the clinical trial, the researchers will immediately report to the  
162 director in charge of the clinical trial of the research institution and contact  
163 Professor Diansan Su, whether related to the procedure under study or not.

164

165 **Additional consent provisions for collection and use of participant data**  
166 **and biological specimens {26b}**

167 Not applicable as no participant data and biological specimens were collected  
168 or used in ancillary studies.

169

170 **Interventions**

171 **Explanation for the choice of comparators {6b}**

172 For the choice of comparators, the central randomization system will be used  
173 for each study site. Following randomization, subjects will receive either (Arm2)  
174 standard monitoring or (Arm1) with additional capnography. The comparator in  
175 this trial is standard monitoring alone (Arm2).

176

### 177 **Intervention description {11a}**

178 The interventions for participants in this trial are capnography-blinded arm  
179 (Arm2) and capnography-open arm (Arm1). Capnography-blinded arm with  
180 standard monitoring, and the capnography-open arm with additional  
181 capnography.

182 In both groups, standard monitoring will include heart rate, SpO<sub>2</sub>,  
183 electrocardiogram, and noninvasive blood pressure in selected patients. In the  
184 capnography-open arm, a sampling line will be connected to a bedside  
185 portable monitor (Capnostream 20; Medtronic, Inc.), so that the capnographic  
186 data of the patients are available for additional noninvasive assessment of  
187 ventilation. In the capnography-blinded arm, no sampling line will be  
188 connected to the bedside portable monitor, and the capnographic data of the  
189 patients will not be visible, so that only the integrated pulse oximetric readout  
190 of the monitor will be visible.

191 Table 2 lists the adverse events of anesthesia and sedation.

192

### 193 **Criteria for discontinuing or modifying allocated interventions {11b}**

194 If participants request to withdraw from the trial, we will discontinue the  
195 allocated intervention for a given trial participant.

196

### 197 **Strategies to improve adherence to interventions {11c}**

198 Adherence to interventions primarily refers to patient self-management  
199 adherence.

200

### 201 ***Relevant concomitant care permitted or prohibited during the trial {11d}***

202 No concomitant care or interventions will be permitted during this trial.

203

### 204 ***Provisions for posttrial care {30}***

205 If a participant suffers harm from this trial, he/she will receive financial  
206 compensation accordingly. The amount of compensation is determined jointly  
207 by the consultation of relevant departments and the participant.

208

### 209 **Outcomes {12}**

210 ***Primary outcome measures.*** The primary outcome of this study is the  
211 incidence of hypoxia ( $75\% \leq \text{SpO}_2 < 90\%$  for  $<60$  s) in the two groups.

212 ***Secondary outcome measures.*** The secondary outcomes comprise the  
213 following:

214 1. The incidence of subclinical respiratory depression ( $90\% \leq \text{SpO}_2 <$   
215  $95\%$ ).

216 2. The incidence of severe hypoxia ( $\text{SpO}_2 < 75\%$  or  $75\% \leq \text{SpO}_2 < 90\%$   
217 for  $\geq 60$  s).

218 3. The incidence of capnography curve decreased by half or more than  
219 the baseline and even disappeared without hypoxia ( $\text{SpO}_2 > 90\%$ ).

220 4. The incidence of other adverse events recorded by tools proposed by  
221 the World Society of Intravenous Anesthesia International Sedation Task  
222 Force.

223

#### 224 **Participant timeline {13}**

225 Figure 1 shows the schedule for enrollment, interventions, assessments, and  
226 visit for participants.

227 When patients enter the gastrointestinal endoscopic operating room, they will  
228 be screened for eligibility by the investigator. If they meet the inclusion criteria  
229 but not the exclusion criteria, the investigator will provide them the fully  
230 informed consent form. After signing the informed consent form, the patients  
231 will be allocated to the capnographic monitoring group or the control group by  
232 the central randomization system.

233 In the capnographic monitoring group, the criteria for apnea will be the  
234 absence of exhaled  $\text{CO}_2$ ; altered ventilation will be defined as a reduction of  
235 end-tidal  $\text{CO}_2$  of more than half of baseline as shown by the capnogram; and  
236 the definition of hypoxia will be  $\text{SpO}_2 < 90\%$ . In the control group, the definition  
237 of hypoxia will be  $\text{SpO}_2 < 90\%$ .

238 In both groups, any sign of apnea, altered ventilation, or hypoxia that prompts  
239 an intervention will consist of (i) increasing oxygen supplementation, (ii) a chin  
240 lift or jaw thrust maneuver, (iii) insert the oropharyngeal airway or  
241 nasopharyngeal airway with a chin lift or jaw thrust maneuver, (iv) artificial  
242 mask ventilation, and (v) tracheal intubation.

243

#### 244 **Sample size {14}**

245 Our previous study showed that the incidence of hypoxia during  
246 gastrointestinal endoscopy with propofol sedation in patients was  
247 approximately 8%. The anticipated effect size of additional capnographic  
248 monitoring was 50%, implying that the hypoxia incidence power analysis  
249 assumes a reduction from 8% to 4%. Between the capnography-open and  
250 capnography-blinded groups, the results of a conventional analysis to detect  
251 differences in proportions (hypoxia). We use PASS 11.0, randomization 1:1,  
252 power of  $1 - \beta = 0.90$  and a two-sided  $\alpha$  level of 5%. We assume a 10%  
253 dropout rate. This results in a requirement of approximately 1800 patients.

254

#### 255 **Recruitment {15}**

256 The schedule of the major study events for each study visit was shown in  
257 Figure 1. In this study, Elderly patients who are scheduled to undergo  
258 gastrointestinal endoscopy with propofol sedation will be included. The entire  
259 process of recruitment and consenting of study participants by members of the

260 research team will be consistent with GCP.

261

262 **Assignment of interventions: allocation**

263 **Sequence generation {16a}**

264 In this trial, we used stratified blocked randomization to design the central  
265 randomization system. Complete baseline data will be collected from  
266 participants, including name, gender, date of birth, etc. After assessing the  
267 patient's eligibility for inclusion, his/her informed consent will be obtained. We  
268 randomly assigned the participants in a ratio of 1:1 to the standard monitoring  
269 group or the additional capnographic monitoring group according to the  
270 allocation sequence of the central randomization system. The length of a  
271 random sequence is not fixed, and 4, 6, and 8 are random.

272

273 **Concealment mechanism {16b}**

274 After obtaining the signed informed consent, participants will be randomly  
275 assigned to the standard monitoring group or the additional capnographic  
276 monitoring group according to the central randomization system. Random  
277 results, random number, and their relationship with groups will be maintained  
278 confidential to the participants throughout the trial. The same nasal cannula  
279 with a carbon dioxide-collecting device will be used in both groups and  
280 connected to the capnographic monitoring device. Participants will not be  
281 aware of their own and others' grouping before, during, and after the

282 gastrointestinal endoscopy procedure.

283

#### 284 **Implementation {16c}**

285 Designated doctors will generate the allocation sequence, enroll participants,  
286 and assign participants to interventions.

287

#### 288 **Assignment of interventions: Blinding**

##### 289 **Who will be blinded {17a}**

290 After assignment to the interventions, only the trial participants will be blinded.

291 The results in the central randomized system will be maintained confidential to  
292 the participants throughout the entire process. The same nasal cannula will be  
293 used in both the standard monitoring group and the additional capnographic  
294 monitoring group, and the sampling line will be connected to a portable beside  
295 monitor. The researcher will ensure that participants are not aware of their own  
296 or other's information of assignment.

297

##### 298 **Procedure for unblinding if needed {17b}**

299 As the trial is single-blind, patients interested in knowing their group could be  
300 informed by the investigator after the analysis of results.

301

#### 302 **Data collection and management**

##### 303 **Plans for assessment and collection of outcomes {18a}**

304 This study is an internal multicenter clinical trial. All data collection physicians  
305 will be specially trained by assessors. We will conduct online meetings  
306 regularly to share the progress of the trial and discuss the problems that we  
307 encounter during the project. Moreover, we will conduct field visits to  
308 subcenters for quality control. We shall also organize the trial data regularly to  
309 check for any data missing, and to promote data quality, we intend to apply  
310 other methods and call the participants as well.

311

312 **Plans to promote participant retention and complete follow-up {18b}**

313 Not applicable as the trial did not involve follow-up, so we have no plans to  
314 promote participant retention and complete the follow-up.

315

316 **Data management {19}**

317 The respective patients' case report form (CRF) entered and/or filled in all  
318 patient data collected during this clinical trial. The study number, subject  
319 number, date of subject information and informed consent will be documented  
320 appropriately in the patient CRF. We will archive the source data in  
321 accordance with GCP guidelines. According to the sponsor's standard  
322 operating procedures, the data manager will be responsible for data  
323 processing, and will conduct regular monitoring to ensure that the dates are  
324 adequate, accurate, and complete. Only after the completion of quality

325 assurance procedures, the database lock will occur.

326

### 327 **Confidentiality {27}**

328 Participants information will be confidential and managed according to the  
329 Data Protection Act, NHS Caldecott Principles, The Research Governance  
330 Framework for Health and Social Care, and the conditions of Research Ethics  
331 Committee (REC) approval.

332

### 333 **Plans for collection, laboratory evaluation, and storage of biological 334 specimens for genetic or molecular analysis in this trial/future use {33}**

335 Not applicable as no biological specimens were collected as part of this trial.

336

### 337 **Statistical methods**

#### 338 **Statistical methods for primary and secondary outcomes {20a}**

339 Data selection for statistical analysis

340 1. Full analysis set (FAS): According to the principle of intention-to-treat  
341 analysis, the full analysis set will include all subjects who are enrolled in the  
342 study.

343 2. Per-protocol set (PPS): The PPS population will include all FAS patients  
344 without major protocol deviations that influence the evaluation of primary  
345 outcome. The efficacy analysis will be performed on the FAS and PPS.

346 3. Safety analysis set (SAS): The safety population will consist of all subjects.

347 Analyses of safety data in the study will be based on the safety population.

348

349 Statistical analysis plan

350 All statistical analyses in this trial will be programmed and calculated using

351 SPSS 23.0 (IBM Inc., Armonk, NY, USA). We intend to use the unpaired *t*-test

352 or Mann–Whitney U test for the main efficacy outcome. When the P value of

353  $\leq 0.05$  will be considered as statistically significant. We will use the  $\chi^2$  test,

354 continuity correction  $\chi^2$  test, or Fisher's exact test to analyse categorical

355 variables. Besides, we will compare the patients' incidence of hypoxia,

356 subclinical hypoxia, and severe hypoxia during the sedated gastrointestinal

357 endoscopy procedure. Fisher's exact test will be conducted to analyze primary

358 and secondary outcomes.

359 Additional analyses

360 Safety analysis: General safety evaluations will be based on the incidence and

361 type of adverse events (AEs). Safety variables will be tabulated and presented

362 for all patients in safety sets. Adverse events will be coded using the tools

363 proposed by the World Society of Intravenous Anesthesia International

364 Sedation Task Force. The number (%) of subjects with any AEs will be

365 summarized.

366

367 **Interim analyses {21b}**

368 Not applicable as we have no plans to conduct any interim analyses, and no

369 one has rights to access to these interim results and decides to terminate the  
370 trial.

371

### 372 **Methods for additional analyzes (e.g., subgroup analyzes) {20b}**

373 The methods used for statistical analyzes will also be used for additional  
374 analyzes for primary and secondary outcomes.

375

### 376 **Methods in the analysis to handle protocol nonadherence and any** 377 **statistical methods to handle missing data**

378 Intention-to-treat (ITT) basis conducts the statistical analysis. Regardless of  
379 protocol adherence, the results of the outcome analyzes will be analyzed as  
380 randomised. The frequency and type of missingness of all variables will be  
381 screened. If missingness is >5% in any variable, we will use multiple  
382 imputation. Complete case analysis will be performed as a sensitivity analysis,  
383 in case of missing data and imputation.

384

### 385 **Plans to provide access to the full protocol, participant-level data, and** 386 **statistical code {31c}**

387 Not applicable as we have no plans to provide access to the full protocol,  
388 participant-level data, and statistical code.

389

### 390 **Oversight and monitoring**

#### 391 **Composition of the coordinating center and trial steering committee {5d}**

392 Diansan Su is responsible for preparing and revising the protocol and

393 disseminating any changes. Renlong Zhou and Weifeng Yu are responsible for  
394 overseeing the study design and protocol, and interpretation of the findings.  
395 Qiuyue Lian and Shaoyi Chen are responsible for coordinating data collection  
396 and analyzes and writing the scientific manuscript. Xiangyang Cheng and Jie  
397 Zhang are responsible for overseeing any statistical analyzes and the study  
398 implementation on the floor follows the protocol.

399 **Composition of the data monitoring committee, its role, and reporting**  
400 **structure {21a}**

401 We do not have composition of the data monitoring committee (DMC).

402

403 **Adverse event reporting and harms {22}**

404 The nasal cannula with a port for collecting exhaled carbon dioxide samples  
405 used for capnographic monitoring is similar to the original nasal cannula and  
406 does not have additional risks. To date, there has been no evidence that this  
407 study may cause any risk or discomfort to participants.

408 We will record any adverse events that occur during the clinical trial,  
409 regardless of whether these events were associated with the the intervention.

410 And all these expected and unexpected trial-related adverse events will be  
411 reported in trial publications.

412

413 **Frequency and plans for auditing trial conduct {23}**

414 The investigators shall maintain all study data according to GCP requirements.

415 The original study data and information will be retained for at least 5 years  
416 after the completion of the trial. Data security and monitoring reports will be  
417 submitted to the ethical committee every 3 months.

418

419 **Plans for communicating important protocol amendments to relevant**  
420 **parties (e.g.,, trial participants, ethical committees) {25}**

421 This clinical trial will be conducted according to ethical committee approval.  
422 Any problem or protocol modifications during the trial will be communicated to  
423 the ethical committees, trial participants, trial registries, journals, and  
424 regulators in a timely manner. Ethical committee's consent will be required to  
425 change the protocol.

426

427 **Dissemination plans {31a}**

428 The participants, healthcare professionals, the public, and other relevant  
429 groups in the form of articles will communicate the results of this trial.

430

431 **Discussion**

432 Worldwide, the number of sedated gastrointestinal endoscopy procedures is  
433 increasing. In China, the overall number of gastrointestinal endoscopies is high  
434 and will continue to increase[1]. The sedation rate was 48.3%, with 47.9%  
435 attributed to gastroscopies and 49.3% to colonoscopies[1]. With the worldwide  
436 aging population, the safety of sedated gastrointestinal endoscopy in elderly  
437 patients is becoming increasingly important. Hypoxia is the most common and  
438 severe complication during sedated gastrointestinal endoscopy procedure.  
439 Therefore, reducing the occurrence of hypoxia remains an extremely important  
440 problem.

441 The primary course of hypoxia in sedated gastrointestinal endoscopy  
442 procedure is hypoventilation caused by respiratory depression. Early detection

443 of respiratory depression and early intervention are vital to prevent hypoxia.  
444 The routine monitoring index SpO<sub>2</sub> cannot completely reflect the real-time  
445 ventilation of patients. As a more sensitive, more real-time monitoring indicator,  
446 capnographic monitoring may be used to reflect respiratory depression before  
447 the onset of hypoxia[11,12].

448 Capnographic monitoring provides quantitative digital readings of the patient's  
449 exhaled and inhaled carbon dioxide levels and graphically display the carbon  
450 dioxide levels over time[13]. It is more sensitive than SpO<sub>2</sub> and can reflect  
451 patient's ventilation in real-time [6].

452 Studies have demonstrated that there can be a lag of up to 2 min between  
453 apnea and a change in breathing pattern and hypoxia[6]. Effective  
454 interventions provided within this time interval can reduce the incidence and  
455 mortality of sedation-related complications. Early detection of respiratory  
456 depression in patients and timely and effective intervention measures can  
457 reduce the occurrence of severe hypoxia, hypercapnia, and even cardiac  
458 arrest, thus improving the prognosis of patients[14].

459 The capnographic monitoring device used in the present study (Capnostream  
460 20; Medtronic, Inc.) is connected to the nasal cannula, which has a carbon  
461 dioxide sampling port and allows breathing through the mouth. It can provide  
462 0–5 L/min oxygen to the patient and offer real-time monitoring of wave form  
463 and the level of patients' exhaled carbon dioxide. We can also obtain the  
464 patient's breath rate. The capnographic monitoring device can also be  
465 connected to a pulse oximeter to monitor the patient's SPO<sub>2</sub> value.  
466 Capnographic monitoring of waveform can intuitively evaluate ventilation in the  
467 experimental group. In this trial, the capnographic criterion for apnea will be

468 the absence of exhaled CO<sub>2</sub>. Altered ventilation will be defined as a reduction  
469 of end-tidal CO<sub>2</sub> of more than half of baseline as shown by the capnogram.  
470 Oxygen desaturation will be defined as a decrease of SaO<sub>2</sub> level to <90%[2].  
471 Currently, no unified conclusion has been drawn on whether end-tidal CO<sub>2</sub>  
472 monitoring can effectively reduce the occurrence of hypoxia during endoscopy.  
473 In 2011, the American Society of Anesthesiologists' Standards for Basic  
474 Anesthetic Monitoring recommended that capnographic should be monitored  
475 in addition to pulse oximetry in moderate sedation cases[15]. However, a joint  
476 statement from the major gastroenterology societies did not recommend  
477 routine capnographic monitoring for patients undergoing moderate sedated  
478 gastrointestinal endoscopy[16]. Recently, standards advocated by the  
479 American Society of Anesthesiologists along with a multisociety task force  
480 updated their practice guidelines for moderate sedation; they go on to suggest  
481 that continuous capnographic monitoring should be used to evaluate the  
482 adequacy of ventilation[17]. In the same year, the American Society for  
483 Gastrointestinal Endoscopy advocated that integrating capnography into  
484 patient monitoring protocols for endoscopic procedures with moderate  
485 sedation has not been shown to improve patient safety[18]. There are also  
486 standards suggesting the need to assess the clinical usefulness of  
487 capnography in patients considered to be at high risk for morbidity from  
488 hypoxemia, such as those with severe cardiovascular disease[19,20]. These  
489 guidelines indicate that there is insufficient evidence for routine capnographic  
490 monitoring in all patients during sedated gastrointestinal endoscopy.  
491 Elderly patients comprise a vulnerable group different from adult patients. They  
492 are more susceptible to respiratory depression and hypoxia. Our previous

493 study showed that the incidence of hypoxia during upper gastrointestinal  
494 endoscopy in patients of all ages who were sedated with propofol was 9% in  
495 China[21], whereas the incidence of hypoxia during sedated gastrointestinal  
496 endoscopy in elderly patients was 15.9%[22]. Hence, capnographic monitoring  
497 may be more valuable during sedated gastrointestinal endoscopy in elderly  
498 patients.

499 Based on existing data, whether end-tidal CO<sub>2</sub> must be routinely monitored  
500 during sedated gastrointestinal endoscopy remains no consensus be reached;  
501 however, there have been few recent studies to add to the scant literature on  
502 this topic. There are also a few clinical trials on capnographic monitoring in  
503 elderly patients. To our knowledge, our trial is the first randomized controlled  
504 study designed to confirm capnographic monitoring in elderly patients during  
505 gastrointestinal endoscopy procedure with sedation. Our study design avoids  
506 some of the limitations of other studies, indicating its more closeness to clinical  
507 practice. We expect that our study would provide a higher level of evidence  
508 and improve the safety of sedated gastrointestinal endoscopy in elderly  
509 patients.

510

## 511 **Trial status**

512 Trial registration: ClinicalTrials.gov, NCT05030870. Registered on September  
513 1, 2021. The protocol version is 2.2, which was approved in November 22,  
514 2021. This study was started on September 1, 2021, and the recruitment  
515 phase will last until December 2023.

516

## 517 **Abbreviations**

518 SpO<sub>2</sub>: hemoglobin oxygen saturation; CRF: case report form; GCP: good  
519 clinical practice; REC: Research Ethics Committee; FAS: full analysis set; PPS:  
520 per-protocol set; SAS: safety analysis set; AEs: adverse events; ITT:  
521 intention-to-treat; DMC: data monitoring committee; CO<sub>2</sub>: carbon dioxide; RCT:  
522 randomized controlled study.

523

## 524 **Declarations**

## 525 **Acknowledgments**

526 Our team would like to thank the patients who have participated in the trial to  
527 date and all the staff at all participating sites.

528

## 529 **Authors' contributions {31b}**

530 Diansan Su is the principal investigator of this clinical trial, came up with the  
531 idea of the study. Renlong Zhou is the senior investigator of this clinical trial.  
532 They were both responsible for the conception and design of the study.  
533 Weifeng Yu is the academic director, led the proposal and design of study.  
534 Qiuyue Lian and Shaoyi Chen contributed equally to this work and they shared  
535 first authorship and contributed to the final manuscript. Qiuyue Lian  
536 participated in the development of the protocol, the trial database and case  
537 report forms. Shaoyi Chen contributed to statistical design of the RCT and  
538 sample size estimations. Qiuyue Lian, Xiangyang Cheng, and Jie Zhang  
539 participated in conducting the experiment and collection of data. All authors  
540 have approved the final manuscript and agree with submission. We will  
541 assigned the authorship for future trial publications according to the

542 contribution. Professional writers will not be used by us.

543

544 **Funding {4}**

545 The National Nature Science Foundation of China (Nos. U21A20357)  
546 supported this study. The funder was not interfere with the analyzes and  
547 interpretation of the trial results or writing of the protocol manuscript.

548

549 **Availability of data and materials {29}**

550 Because of Chinese data protection rules and regulations, the participant-level  
551 data set cannot be made publicly available. If request, the statistical code is  
552 available.

553

554 **Ethics approval and consent to participate {24}**

555 The Ethics Commission of Renji Hospital Shanghai Jiaotong University School  
556 of Medicine approved and supported this clinical trial (KY2021-014).

557

558 **Consent for publication {32}**

559 Not applicable as we are not intend to publish personal information about an  
560 individual.

561

562 **Competing interests {28}**

563 The authors declare that they have no competing interests.

649

650 **Table 1 Inclusion/exclusion criteria**

Inclusion criteria	Exclusion criteria
1) Aged $\geq 65$ and $< 80$ years	1) Coagulation disorders or a tendency of nose bleeding
2) Scheduled to undergo gastrointestinal endoscopy procedure with sedation	2) An episode/exacerbation of congestive heart failure that requires a change in medication, diet, or hospitalization from any cause in the past 6 months
3) Signed the informed consent form	3) Severe aortic stenosis or mitral stenosis
4) American Society of Anesthesiologists (ASA) classification I-II	4) Cardiac surgery involving thoracotomy (e.g., coronary artery bypass graft, valve replacement surgery) in the past 6 months
	5) Acute myocardial infarction in the past 6 months
	6) Acute arrhythmia (including any tachycardia or bradycardia) with fluid of hemodynamics instability
	7) Diagnosed with chronic obstructive pulmonary disease or current other acute or chronic lung disease requiring supplemental chronic or intermittent oxygen therapy
	8) Preexisting bradycardia (heart rate $< 50$ /min), or hypoxia ( $\text{SaO}_2 < 90\%$ )
	9) Need supplemental oxygen because of preexisting diseases
	10) Emergency procedure or surgery
	11) Multiple trauma
	12) Upper respiratory tract infection
	13) Allergy to propofol or tape and adhesives

651 **Table 2 Adverse events of anesthesia and sedation**

<b>Step 1: Was there one or more adverse events associated with this sedation encounter?</b>				
<input type="radio"/> No, this form is now complete.		<input type="radio"/> Yes, fill out remainder of form below.		
<b>Step 2: Please DESCRIBE the adverse event(s). Check all that apply.</b>				
<b>Minimal risk descriptors</b>	<b>Minor risk descriptors</b>		<b>Sentinel risk descriptors</b>	
<input type="radio"/> Vomiting/Retching	<input type="radio"/> Oxygen desaturation (75-90%) for < 60s		<input type="radio"/> Oxygen desaturation, severe (<75% at any time) or prolonged (<90% for >60s)	Other, specify below
<input type="radio"/> Sub-clinical respiratory depression	<input type="radio"/> Apnoea not prolonged		<input type="radio"/> Apnoea, prolonged (>60s)	
<input type="radio"/> Muscle rigidity, Myoclonus	<input type="radio"/> Airway obstruction		<input type="radio"/> Cardiovascular collapse/shock	
<input type="radio"/> Hypersalivation	<input type="radio"/> Failed sedation		<input type="radio"/> Cardiac arrest/absent pulse	
<input type="radio"/> Paradoxical response	<input type="radio"/> Allergic reaction without anaphylaxis			
<input type="radio"/> Recovery agitation	<input type="radio"/> Bradycardia			
<input type="radio"/> Prolonged recovery	<input type="radio"/> Tachycardia			
	<input type="radio"/> Hypotension			
	<input type="radio"/> Hypertension			
	<input type="radio"/> Seizure			
<b>Step 3: Please note the INTERVENTIONS performed to treat the adverse events(s). Check all that apply.</b>				
<b>Minimal risk</b>	<b>Minor risk</b>	<b>Moderate risk</b>	<b>Sentinel intervention</b>	
<input type="radio"/> No intervention performed	<input type="radio"/> Airway repositioning	<input type="radio"/> Bag valve mask-assisted	<input type="radio"/> Chest compressions	Other, specify

	ng	ventilation		below
<input type="radio"/> Tactile stimulation	<input type="radio"/> Tactile stimulation	<input type="radio"/> Laryngeal mask airway	<input type="radio"/> Tracheal intubation	
<input type="radio"/> Additional sedative(s)	or the administration of:	<input type="radio"/> Ora/nasal airway	or the administration of:	
<input type="radio"/> Antiemetic	<input type="radio"/> Supplemental oxygen, new or increased	<input type="radio"/> CPAP	<input type="radio"/> Neuromuscular block	
<input type="radio"/> Antihistamine	<input type="radio"/> Antisialagogue	or the administration of:	<input type="radio"/> Pressor/epinephrine	
		<input type="radio"/> Reversal agents	<input type="radio"/> Atropine to treat bradycardia	
		<input type="radio"/> Rapid i.v.fluids		
		<input type="radio"/> Anticonvulsanti.v		

**Step 4: Please note the OUTCOME of the adverse events(s). Check all that apply.**

Minimal risk outcome	Moderate risk outcome	Sentinel outcome	
<input type="radio"/> No adverse outcome	<input type="radio"/> Unplanned hospitalisation or escalation of care	<input type="radio"/> Death	Other, specify below
		<input type="radio"/> Permanent neurological deficit	
		<input type="radio"/> Pulmonary aspiration syndrome	

**Step 5: Assign a SEVERITY rating to the adverse event(s) associated with this sedation encounter.**

If there are any options checked in the Sentinel columns above, then this is a Sentinel adverse event.

If the most serious option(s) checked above are Moderate risk, then this is a Moderate risk adverse event.

If the most serious option(s) checked above are Minor risk, then this is a Minor risk adverse event.

If the most serious option(s) checked above are Minimal risk, then this is a Minimal risk adverse event.

652 Footnotes:

653 a. "Sub-clinical respiratory depression" is defined as capnographic abnormalities suggesting respiratory  
654 depression that do not manifest clinically.

655 b. "Paradoxical response" is defined as unanticipated restlessness or agitation in response to sedatives.

656 c. "Recovery agitation" is defined as abnormal patient affect or behaviors during the recovery phase that  
657 can include crying, agitation, delirium, dysphoria, hallucinations, or nightmares.

658 d. "Prolonged recovery" is defined as failure to return to baseline clinical status within 2 hours.

659 e. "Failed sedation" is defined as inability to attain suitable conditions to humanely perform the  
660 procedure.

661 f. Alteration in vitals signs (bradycardia, tachycardia, hypotension, hypertension) is defined as a change  
662 of >25% from baseline.

663 g. "Cardiovascular collapse/shock" is defined as clinical evidence of inadequate perfusion.

664 h. Examples of "escalation of care" include transfer from ward to intensive care, and prolonged  
665 hospitalisation.

666 i. "Pulmonary aspiration syndrome" is defined as known or suspected inhalation of foreign material such  
667 as gastric contents into the respiratory tract associated with new or worsening respiratory signs.

668 j. "Sentinel" adverse events are those critical enough to represent real or serious imminent risk of serious  
669 and major patient injury. Once recognized, they warrant immediate and aggressive rescue interventions.  
670 Once clinically concluded, they warrant immediate reporting within sedation care systems, and the  
671 highest level of peer scrutiny for continuous quality improvement.

672 k. "Moderate" adverse events are those that, while not sentinel, are serious enough to quickly endanger  
673 the patient if not promptly managed. Once clinically concluded, they warrant timely reporting within  
674 sedation care systems, and periodic peer scrutiny for continuous quality improvemet.

675 l. "Minor" adverse events are those encountered periodically in most sedation settings, and that pose little  
676 threat given appropriate sedationist skills and monitoring.

677 m. "Minimal" adverse events are those that alone present no danger of permanent harm to the patient.
