18 **Abstract**

19 (+)-7-*iso*-jasmonoyl-L-isoleucine (JA-Ile) is a lipid-derived phytohormone
20 implicated in plant development, reproduction, and defense in response to pathogens and
21 herbivorous insects. All these effects are instigated by the perception of JA-Ile by the
22 COI1-JAZ co-receptor in the plant body, which in *Arabidopsis thaliana*, is profoundly
23 influenced by the short JAZ degron sequence (V/L)P(Q/I)AR(R/K) of the JAZ protein.

24 Here, we report that *S/JAZ-S/COI1*, the COI1-JAZ co-receptor found in the tomato
25 plant, relies on the extended JAZ degron sequence (V/L)P(Q/I)AR(R/K)XSLX instead of
26 the canonical JAZ degron. This finding illuminates our understanding of the mechanism
27 of JA-Ile perception in this plant, and will inform the genetic modification of the *S/COI1*-
28 *S/JAZ* co-receptor to improve JA-Ile perception and the development of the synthetic
29 agonists / antagonists.

30

31 Lipid-derived (+)-7-*iso*-jasmonoyl-L-isoleucine (JA-Ile) is a major class of
32 phytohormones implicated in plant development, reproduction, and the defense response
33 of plants against pathogens and herbivorous insects.^{1,2} Exposure of plants to external
34 stress causes jasmonate signaling, which is triggered by the production of JA-Ile from
35 jasmonic acid (JA).^{3,4} Perception of JA-Ile by the COI1-JAZ co-receptor cause
36 upregulation of of JA-responsive genes, leading to the expression of JAZ (JASMONATE
37 ZIM-DOMAIN) repressor protein –a hub of jasmonate signaling.^{5,6}

38 The JAZ protein contains two major functional domains: Jas and TIFY. In the
39 absence of JA-Ile, the Jas domain causes JAZ to interact with various transcription factors
40 (TFs), including the master regulator MYC2.⁷ The ethylene-responsive element binding
41 factor-associated amphiphilic repression (EAR) domain in TIFY is a binding site for
42 Novel Interactor of JAZ (NINJA) and recruits co-repressor TOPLESS (TPL) through
43 NINJA.⁸ Through these interactions, JAZ constructs a transcriptional repression
44 machinery consisting of the MYC2-JAZ-NINJA-TPL complex, which repress the
45 expression of JA-responsive gene. In the presence of JA-Ile, JAZ also plays an important
46 role in releasing the repression of TFs. The Jas motif is also important for protein-protein
47 interaction with COI1, a subunit of SCF^{COI1}E3 ubiquitin ligase, to form COI1-JA-Ile-JAZ
48 co-receptor complex for JA-Ile ligand.⁹ JA-Ile cause COI1-JAZ co-receptor formation
49 and subsequent ubiquitination and degradation of JAZ to derepress the expression of JA-
50 responsive genes.¹⁰⁻¹²

51 Recently, it has become clear that *JAZ* genes function redundantly; however, each
52 *JAZ* subfamily gene is also responsible for its own unique function,¹³⁻¹⁷ and differences
53 in the sequence of the Jas motif profoundly influence the unique function of each JAZ.
54 This is in part because the function of JAZ depends on how strongly and with which of
55 the many TFs it interacts.¹³ The Jas motif also affects the lifespan of each JAZ in plant
56 cells (through the affinity between JAZ and COI1) which in turn determines the duration
57 of effect of each JAZ's unique function.¹³

58 The crystal structure of the COI1-JA-Ile-JAZ1 degron peptide revealed that the
59 short JAZ degron sequence in the Jas motif is responsible for COI1-JA-Ile-JAZ1 complex
60 formation based on the discovery of a hydrogen bond-network between the JAZ1 degron
61 sequence LPIARR and the COI1-JA-Ile complex.¹⁸ JAZ belongs to the TIFY protein
62 family, but only the JAZ subfamily incorporates the Jas motif, including short canonical

63 degnon sequence LPIAR(R/K) necessary to trap JA-Ile (**Figure 1a&1b**). The JAZ degnon
64 sequence is highly conserved among plant species, except for the two non-canonical
65 degnon sequences IPMQRK of *FaJAZs* found in the strawberry plant *Fragaria X*
66 *ananassa*, and MPIARK of *EcJAZ1* found in finger millet *Eleusine coracana* (L.)
67 Gaertn.¹⁹⁻²¹

68 Small differences in the *Arabidopsis* JAZ degnon sequences (identity 37.0% in
69 **Figure 1a**) are considered to account for the difference in affinity (K_D) between JAZ and
70 COI1-JA-Ile.²² However, the 12 JAZs of *Solanum lycopersicum* have a remarkably well-
71 conserved JAZ degnon sequence (V/L)P(Q/I)AR(R/K) (identity 46.6% in **Figure 1a**),
72 suggesting their affinities (K_D) for the *S/COI1*-JA-Ile complex are very similar (**Figure**
73 **1a**). Here, we report the first comprehensive study of the affinity of the *S/JAZ*-*S/COI1*
74 co-receptor for JA-Ile, and demonstrate that the perception of JA-Ile depends on the
75 extended JAZ degnon sequence (V/L)P(Q/I)AR(R/K)XSLX. This use of an extended
76 degnon sequence (instead of the canonical short JAZ degnon sequence) accounts for the
77 different affinities of *S/JAZ* and *S/COI1*-JA-Ile.

78
79

80 **Results**

81 **The affinities of *S/JAZ1-11/13* for *S/COI1*-JA-Ile are different**

82 All the *TIFY* sequences of the JAZ proteins of *Solanum lycopersicum* have been
83 previously reported: 19 *TIFY* genes including 12 canonical *JAZ* (*S/JAZ1-11/13*) and non-
84 canonical *S/JAZ12* genes are encoded in the *Solanum lycopersicum* genome.²³⁻²⁵ The Jas
85 motifs of the 12 canonical *S/JAZs* are remarkably similar to the *Arabidopsis* consensus
86 Jas motif SLX₂FX₂KRX₂RX₅PY, and the JAZ degnon sequence (V/L)P(Q/I)AR(R/K)
87 wherein the hydrophobic L/V is conjugated with P(Q/I)AR and followed by basic R/K is
88 conserved in 8 out of 12 *S/JAZs* (*S/JAZ1-6/8/13*) (**Figures 1a & 1b**). Accordingly,
89 *S/COI1-S/JAZ1-6/8/13* are expected to perceive JA-Ile with equal affinity, whereas
90 *S/COI1-S/JAZ9-11* (which incorporate a non-canonical JAZ degnon) are not expected to
91 perceive it at all. Accordingly, we examined the affinities of 12 *S/JAZ* proteins for the
92 *S/COI1*-JA-Ile complex by pull-down assay.

93 *S/JAZ* genes were cloned from the tomato cultivar Micro-Tom and their FLAG-
94 tag-fused proteins FLAG-*S/JAZ1-11/13* expressed using the wheat germ-derived cell-free

95 protein expression system (**Figure S1**). The protein GST-fused *S/COI1* (GST-*S/COI1*)
96 was also expressed in Sf9 cultured insect cells (**Figure S2**). *Arabidopsis* ASK protein was
97 co-expressed to improve the stability of *S/COI1*.²⁶ As expected, *S/JAZ1-3/5-8* but not
98 FLAG-*S/JAZ9-11* pull-down the GST-*S/COI1* in the presence of 100 nM JA-Ile (**Figure**
99 **2a**). However, *S/JAZ4/13* (which incorporates the same canonical JAZ degron LPIARR
100 as *S/JAZ1-3*) could not pull-down the GST-*S/COI1* under the same condition (**Figures**
101 **1b and 2a**). Identical results were obtained using coronatine (COR), a naturally occurring
102 phytotoxin known as structural mimic of JA-Ile, in place of JA-Ile, suggesting that COR
103 is perceived by the co-receptor in a similar manner to JA-Ile (**Figure S3**). These results
104 indicate that sequences other than the highly conserved *S/JAZ* degron in full-length JAZ
105 affect the perception of JA-Ile by the *S/COI1-S/JAZ* co-receptor.

106 To examine the effect of the exo-degron sequence quantitatively, we designed and
107 synthesized fluorescein-tagged *S/JAZ1-11/13* degron short peptides (*S/JAZP1-11/13*) of
108 27 amino acids (**Figure 3a** and **Figure S4 -S5**) based on previous work on *Arabidopsis*
109 *COI1-JAZ*.²² The pull-down assay using the GST-*S/COI1* and Fl-*S/JAZ* degron peptides
110 in the presence of increasing concentrations of JA-Ile yielded very similar results to those
111 obtained using full-length *S/JAZs* (**Figures 2b-d**). Therefore, the affinity of full-length
112 JAZ was confirmed to depend on the sequence in these short peptides. The observed
113 affinities were quantitatively assessed in AlphaScreen luminescence proximity assays
114 using *S/JAZPs* and GST-*S/COI1* in the presence of 0-30 μ M JA-Ile (**Figure 3b** and
115 **Figure S6**),^{7,27} and found to be in good accordance with the results obtained by pull-down
116 assay: $20 > K_d$ for *S/JAZ1/5-8* of strong affinity, $150 > K_d$ for *S/JAZ2/3* of weak affinity,
117 $K_d > 400$ for *S/JAZ4/9-11/13* of no/little affinity (**Table 1**). Similar results were obtained
118 using COR (**Figures S7 and S8**).

119

120 Hormone perception relies on extended JAZ degron sequences in tomato 121 *S/JAZs*

122 Here we focused on the relationship between the degron sequences of *S/JAZPs*
123 and their K_d values. The short JAZ degron sequence (L/V)P(Q/I)AR(R/K) was highly
124 conserved in *S/JAZP1-6/8/13* (**Figure 3a**). *S/JAZP5/6/8*, which incorporate the JAZ
125 degron sequence VPQARK all have strong affinity for *S/COI1*-JA-Ile. In contrast,

126 remarkable differences in affinity was observed for *S/JAZP1-4/13*, whose degnon
127 sequence is LPIARR: only *S/JAZP1* showed moderate affinity for *S/COI1-JA-Ile*; the
128 others had weak/no affinity. Among *S/JAZ1-4/13*, the difference can be found in
129 downstream-of-degnon (DOD) sequence XSLX (**Figure 3a**). This strongly suggests that
130 sequences longer than the canonical JAZ degnon influence the affinity of *S/JAZs* for
131 *S/COI1-JA-Ile*.

132 To confirm the effect of exo-JAZ-degnon sequence within *S/JAZPs* on their
133 affinity, we prepared chimeric *S/JAZPs* of swapped sequence and submitted them to the
134 AlphaScreen assay. First, we swapped the two JAZ-degnon sequences VPQARK of
135 *S/JAZP5/6/8* and LPIARR of *S/JAZP1-4/13* to examine the effect of JAZ degnon
136 sequence for the difference in affinity. The *N*-terminal region of high-affinity peptide
137 *S/JAZP5* including JAZ-degnon VPQARK was swapped with that of moderate/little-
138 affinity *S/JAZP1/4* including JAZ-degnon LPIARR to provide the swapped peptide
139 *S/JAZP1/4-5* (**Figures 4a, S9 and S10**). Then, we examined whether the difference in
140 JAZ degnon sequence of *S/JAZs* affect the affinity with *S/COI1-JA-Ile* (**Figure 4ab**, and
141 S11). As shown in Figure 4b, high affinity of *S/JAZP5* was moderately decreased by
142 swapping with *S/JAZP1/4* ($K_d = 4.2$ nM for *S/JAZP5* to $K_d = 16.5$ nM for *S/JAZP1/4-5*).
143 The effect of swapping was moderate and the complete swapping of their affinities did
144 not occur. This result suggested that the differences in JAZ degnon alone cannot fully
145 account for the difference in their affinities, which must therefore be influenced by exo-
146 JAZ-degnon sequences in addition to the canonical JAZ degnon.

147 To examine the effect of DOD sequence, we studied *S/JAZP1-4/13* which
148 incorporate the same JAZ degnon sequence LPIARR and alternative DOD sequence
149 XSLX. We focused on three *S/JAZPs*, *S/JAZP1* of strong affinity ($K_d = 9.2$ nM), *S/JAZP3*
150 of moderate affinity ($K_d = 136$ nM), and *S/JAZP4* of no affinity ($K_d = 1776$ nM). We
151 prepared the *S/JAZP1-3DOD* and *S/JAZP1-4DOD* in which DOD sequence of *S/JAZP1*
152 was swapped with that of *S/JAZP3* and *S/JAZP4*, respectively (**Figure 4a**, and **S9–11**).
153 As shown in **Figure 5ab**, their affinities with *S/COI1-JA-Ile* were moderately dropped by
154 this swapping ($K_d = 28.4$ nM for *S/JAZP1-3DOD* and $K_d = 46.9$ nM for *S/JAZP1-4DOD*).
155 This result confirmed that DOD sequence in addition to JAZ degnon affects the affinity
156 between *S/JAZ* and *S/COI1-JA-Ile*. Next we examine whether DOD sequence also affect
157 the affinity in *S/JAZP5/6/8* of another JAZ degnon sequence VPQARK in common. As

158 *S/JAZP5/6/8* have the same DOD sequence of ASLA, we replaced DOD of *S/JAZP5* of
159 strong affinity ($K_d = 4.2$ nM) to with that of *S/JAZ2* of weak affinity ($K_d = 134$ nM). We
160 prepared DOD swapped peptides *S/JAZP5-2DOD* (ASLA of *S/JAZ5* to NSLT of *S/JAZ2*)
161 and *S/JAZP2-5DOD* (NSLT of *S/JAZ2* to ASLA of *S/JAZ5*) (**Figures 4a**, and **S9–11**).
162 Their affinities with *S/COI1-JA-Ile* were affected by this swapping ($K_d = 11.7$ nM for
163 *S/JAZP5-2DOD* and $K_d = 42.7$ nM for *S/JAZP2-5DOD*, **Figure 5cd**). This result
164 suggested that DOD sequence in *S/JAZ5/6/8* also affects the affinity with *S/COI1-JA-Ile*.

165 Moreover, we swapped the extended JAZ degron sequence including JAZ-degron
166 and DOD to prepare the swapped peptides of *S/JAZP5-2* (DLPIARRNSLT of *S/JAZ2*
167 into AVPQARKASLA of *S/JAZ5*) and *S/JAZP2-5* (AVPQARKASLA of *S/JAZ5* into
168 DLPIARRNSLT of *S/JAZ2*) (**Figure 4a**, and **S9–11**). Their affinity with *S/COI1-JA-Ile*
169 was completely replaced each other by this sequence swapping ($K_d = 88.8$ nM for
170 *S/JAZP5-2* and $K_d = 5.0$ nM for *S/JAZP2-5*, respectively, **Figure 5ef**). This result
171 confirmed that extended JAZ degron sequence including JAZ-degron and DOD affects
172 the affinity of in *S/JAZ* with *S/COI1-JA-Ile*.

173 From all of these results, we concluded that extended-JAZ-degron sequences,
174 VPQARKASLA or LPIARRXSLX, determine the affinity of *S/JAZs* with *S/COI1-JA-Ile*.

175

176 ***In silico* simulation demonstrated the role of extended JAZ degron sequences**
177 **in *S/COI1-JA-Ile-S/JAZ* complex formation.**

178 *In silico* docking simulation studies using the crystal structure of *Arabidopsis*
179 *COI1-JA-Ile-JAZ1* have previously enabled the study of the JA-Ile binding mode of the
180 *COI1-JAZ* co-receptor of other plant species, such as *Phaseolus lunatus*, *Eleusine*
181 *coracana* (L.) Gaertn, *Fragaria vesca*, and *Fragaria × ananassa*.^{20,21,28,29} The
182 contribution of the extended JAZ degron sequence to *S/COI1-JA-Ile-S/JAZ* complex
183 formation was examined by comparing the crystal structure of *Arabidopsis* *COI1-JA-Ile-*
184 *JAZ1* with the *in silico* interaction models of *S/COI1-JA-Ile-S/JAZ1* and *S/COI1-JA-Ile-*
185 *S/JAZ5*, which have an affinity for JA-Ile. A homology model of *S/COI1* was obtained
186 with MOE based on the crystal structure of *AtCOI1* complexed with JA-Ile and using
187 *AtJAZ1* (PDB ID: 3OGL) as a template (the sequence identity of *S/COI1* and *AtCOI1* is
188 68.1%). Then, *AtJAZ1* was replaced with *S/JAZ1* or *S/JAZ5*. The obtained models of
189 these complexes (*S/COI1-JA-Ile-S/JAZ1* and *S/COI1-JA-Ile-S/JAZ5*) were then used for

190 subsequent molecular dynamics (MD) simulations. Root means square deviation (RMSD)
191 values indicated that the structures reached equilibrium in after 50 ns or more (**Figure**
192 **6ab**). There was no significant difference in the interaction of the canonical JAZ degron
193 sequence in JAZ/*S/JAZ* with COI1/*S/COI1* and the ligand JA-Ile, or in the hydrogen-
194 bonding network formed around JA-Ile (**Figures 6c-e, and 7a-f**) an any of the three
195 complexes. In addition, no direct interaction between the DOD sequence of *S/JAZs* and
196 JA-Ile was observed in *S/COI1-JA-Ile-S/JAZ1/5*. These results suggest that the DOD
197 sequence in *S/JAZs* contributes to the enhancement of the interaction with *S/COI1*. Next,
198 we compared the interaction between the DOD sequence and *S/COI1* in *S/COI1-JA-Ile-*
199 *S/JAZ1/5* with the interaction between the corresponding sequence in JAZ1 (ASLH) and
200 COI1. In COI1-JA-Ile-JAZ1, weak interaction through one hydrogen bond was found
201 between the DOD sequence and COI1, whereas in *S/COI1-JA-Ile-S/JAZ1* and *S/COI1-*
202 *JAIle-S/JAZ5*, strong interaction by several hydrogen bonds or hydrophobic interactions
203 were found (**Figure 7bc and hi**). This indicates that the DOD sequence in *S/JAZ*
204 significantly contributes to the formation of the *S/COI1-JA-Ile-S/JAZ* complex, in support
205 of the results of the wet experiments.

206

207

208 **Discussion**

209 JAZ functions as a repressor of numerous TFs in plant cells, and the differences
210 in function between JAZ family proteins are profoundly affected by how strongly and
211 with which of the many TFs each JAZ interacts. Since JAZs interact with many TFs
212 through the Jas motif, differences in this motif can account for differences in the function
213 of JAZs. In addition, JAZ interacts with the COI1-JA-Ile complex using the degron
214 sequence within the Jas motif and ubiquitinated and degraded as a substrate for E3
215 ubiquitin ligase. A small difference in the degron sequence of each JAZ can profoundly
216 impact the duration of JAZ function because it affects the lifetime of each JAZ in the
217 plant cell. Therefore, differences in the strength of the interaction between each JAZ and
218 the COI1-JA-Ile complex affect the function of each JAZ.³⁰

219 This study is the first comprehensive investigation into the affinity of the *S/JAZ-*
220 *S/COI1* co-receptor for JA-Ile. Surprisingly, *S/JAZ9-11* were found to have no affinity for
221 *S/COI1-JA-Ile*, despite having a canonical JAZ degron sequence. In transcript expression

222 of *S/JAZs* on JA-treated Micro-Tom, *S/JAZ9-11* are also JA-responsive: *S/JAZ9/10* are
223 weakly induced in both roots and leaves, and *S/JAZ11* is strongly induced in roots but
224 weakly in leaves.²³ In the case of *Arabidopsis*, non-canonical *JAZ7/8/13* lacking a
225 conserved degron sequence do not have affinity for COI1-JA-Ile and play a unique role
226 in transcriptional repression in plant cells.^{31,32} *JAZ10.4*, an alternative splice variant of
227 *JAZ10*, is involved in the negative feedback regulation of JA signaling and is responsible
228 for the delayed repression of activated JA signals.³³ A similar function is inferred for JA-
229 responsive *S/JAZ9-11*, despite its lack of affinity for SlCOI1-JA-Ile.

230 The crystal structure of *Arabidopsis* COI1-JA-Ile-JAZ1 complex revealed
231 important details regarding the interaction between JAZ and COI1-JA-Ile complex. The
232 short canonical degron sequence LPIARR of JAZ1 overlies the top of JA-Ile binding
233 pocket of COI1, covering the JA-Ile trapped by COI1, and interacting with both COI1
234 and JA-Ile. Detailed analyses revealed that each amino acid in the LPIARR sequence
235 interacts with JA-Ile by hydrogen-bond formation (LPIARR) or hydrophobic interaction
236 (LPIARR). Thus, the change in any amino acid in conserved LPIAR(R/K) sequence will
237 affect the affinity between JAZ and COI1-JA-Ile. Comparison of the amino acid
238 sequences of the JAZ degron among the *Arabidopsis* functional JAZs showed small
239 differences from LPIARR of JAZ1, which will be responsible for the difference in affinity
240 for COI1-JA-Ile among the JAZs (K_d 7-34 for JA-Ile on fluorescence anisotropy assay).³⁴
241 Small differences in the *Arabidopsis* JAZ degron sequences are considered responsible
242 for difference in their affinity.

243 In contrast, the degron sequence differences among functional *S/JAZs* are smaller
244 than those of *Arabidopsis* JAZs, but, nevertheless, each *S/JAZ* binds with different
245 affinities to SlCOI1-JA-Ile (**Figures 2 and 3 & Table 1**). Based on the results of the
246 AlphaScreen assay, their affinities with SlCOI1-JA-Ile can be categorized into three
247 groups: *S/JAZ1/5-8* of strong affinity ($20 > K_d$), *S/JAZ2/3* of weak affinity ($150 > K_d$),
248 *S/JAZ4/9-11/13* of no/little affinity ($K_d > 400$). Especially, a large gap in affinity with
249 SlCOI1-JA-Ile was observed among *S/JAZ1-4/13* in spite of no difference in their JAZ
250 degron sequences.

251 We prepared the swapped *S/JAZPs* and found that their affinity with SlCOI1-JA-
252 Ile strongly depends on the extended JAZ degron sequence of VPQARKASLA or
253 LPIARRXSLX (**Figures 4 and 5**).

254 The short degron sequence (V/L)P(Q/I)AR(R/K) has been hypothesized to play a
255 critical role in hormone reception due to its high degree of conservation across numerous
256 plant species. The only reported exception is the case of wild strawberry *Fragaria X*
257 *ananassa* which uses the non-canonical JAZ degron sequence IPMQRK instead. Our
258 result confirmed that tomato *S/JAZs* employ the extended JAZ degron sequence of
259 (V/L)P(Q/I)AR(R/K)XSLX for the perception of JA-Ile. The contribution of extended
260 JAZ-degron sequence in the complex formation of *S/COI1-JA-Ile-S/JAZs* were further
261 underpinned by using the *in silico* interaction models generated from reported crystal
262 structure of *Arabidopsis* COI1-JA-Ile-JAZ1 (**Figure 6**). The DOD sequence in *S/JAZ*
263 formed strong hydrogen bond network with *S/COI1* to improve the stability of complex
264 (**Figure 7**). In the interaction models of *S/COI1-JA-Ile-S/JAZ1/5*, the canonical JAZ
265 degron of *S/JAZs* retains the same interaction as that of *AtJAZs*. Then, why do
266 *S/JAZ1/2/3/4/13*, which have LPIARR as a common canonical JAZ degron, have
267 different affinities with *S/COI1-JA-Ile*? Swapping experiments have shown that this is
268 due to differences in the DOD sequence; when the DOD sequence of *S/JAZ1* was replaced
269 with that of *S/JAZ3/4*, the affinity was markedly decreased (*S/JAZ1-3/4DOD* in **Figures**
270 **4a&5ab**). This indicates that the DOD sequence of *S/JAZ3/4* negatively affects the
271 interaction with *S/COI1-JA-Ile*. Specifically, two substitutions in the DOD sequence of
272 *S/JAZ1*, A166S and T168H/Y, are presumed to negatively affect the interaction between
273 the LPIARR sequence and *S/COI1-JA-Ile*. This is the first report to demonstrate that the
274 longer sequences than canonical JAZ degron are employed for hormone perception of
275 *S/COI1-S/JAZ* co-receptor.

276 *S/JAZ7* is unique among *S/JAZs* having three amino acid residues in the extended
277 JAZ degron (¹⁷⁵A, ¹⁷⁶M, and ¹⁸¹T) which are not found in other *S/JAZs* (**Figure 3a**).
278 *S/JAZ7* has the extended JAZ degron sequence of LAMARRATLA in which the P(Q/I)
279 in the canonical degron (V/L)P(Q/I)AR(R/K) is replaced by ¹⁷⁵A¹⁷⁶M and the highly
280 conserved S in the DOD sequence XSLX is replaced by ¹⁸¹T. In the *Arabidopsis* COI1-
281 JA-Ile-JAZ1 crystal structure, PI sequence in the canonical JAZ degron of JAZ1 plays
282 an important role in the interaction with COI1,¹⁸ however, *S/JAZ7* lacking this sequence
283 has a moderate affinity with $K_d = 16.2$ nM (**Table 1**). This suggests that *S/JAZ7* may
284 interact with *S/COI1-JA-Ile* in a manner different from other *S/JAZs*.

285

286 **Conclusion**

287 A comprehensive study on ligand perception of *S/JAZ-S/COI1* was performed.
288 The results showed that the affinity of *S/JAZ* for *S/COI-JA-Ile* depends on the extended
289 degron sequence, not on the canonical degron sequence. It was reported that *S/JAZ9-11* of
290 no affinity for *S/COI-JA-Ile* is also JA-inducible,²³ suggesting that they have unique
291 functions, such as suppression of JA signaling, in plant cells. Our new finding will provide
292 further insight for the mechanism of hormone perception in edible tomato which leads to
293 the genetic modification of *S/COI1-S/JAZ* co-receptor to improve hormone perception
294 and development of the synthetic agonist/antagonist.

295

296 **Materials and Methods**

297 All chemical reagents and solvents were obtained from commercial suppliers
298 (Wako Pure Chemical Industries Co. Ltd., Nacalai Tesque Co., Ltd., Watanabe Chemical
299 Industries Co. Ltd., Thermo Fisher Scientific K.K., GE Healthcare) and used without
300 further purification. Coronatine (COR) and (+)-7-iso-JA-L-Ile (JA-Ile) were prepared
301 according to the previous references.^{1,35,36} DNA purification was performed using GENE
302 PERP STAR PI-80X (KURABO, Osaka, Japan). Ultraviolet (UV)-visible spectra were
303 recorded on a UV-2600 spectrophotometer (Shimadzu, Kyoto, Japan). The AlphaScreen
304 assay was carried out on an EnVision (PerkinElmer, Inc., CA, US). SDS-PAGE and
305 Western blotting were performed using a Mini-Protean III electrophoresis apparatus (Bio-
306 Rad Laboratories, Inc., US), Tras-Blot Turbo (Bio-Rad Laboratories, Inc., US) and iBind
307 Flex (Thermo Fisher Scientific K.K., CA, US). Chemiluminescent images were detected
308 using the Amersham Imager 680 (GE Healthcare, CA, US). Reversed-phase high-
309 performance liquid chromatography (HPLC) was performed on a PU-4180 plus with UV-
310 4075 and MD-4010 detectors (JASCO, Tokyo, Japan). Absorbance at 220 nm and 488
311 nm was monitored by an MD-4010 photodiode array detector (PDA). MALDI-TOF MS
312 analysis was performed on an Autoflex Max (Bruker Daltonics Inc., MA, US). The 3D
313 structures were constructed using MOE 2020.09 software (Chemical Computing Groups,
314 Montreal, Canada).

315

316 **Preparation of the *S/COI1* and *S/JAZs* proteins**

317 Standard methods for cloning were used, and PCR-amplified DNA fragments were
318 sequenced after cloning into the vectors. The plasmids of GST-fused AtCOI1 or AtASK1
319 (pFB-GTE-COI1 and pFB-HTB-ASK1) were obtained from Addgene
320 (<https://www.addgene.org/>), and the plasmid for wheat-derived cell-free protein
321 expression system (pEU-FLAG-GW-STOP) was kindly gifted from Drs. Koji Miyamoto
322 (Teikyo University), Kazunori Okada (The University of Tokyo), and Tatsuya Sawasaki
323 (Ehime University). The full-length CDS of *SjCOI1* was obtained from Osaka Prefecture
324 University (kindly supported by Prof. Koh Aoki) and was cloned into pFB-GTE-COI1 to
325 prepare the plasmid of GST-fused *SjCOI1*. These *SjCOI1* and *AtASK1* proteins were co-
326 expressed in insect cells and purified by Glutathione Sepharose 4B (GE Healthcare)
327 according to the previous reports.^{18,34,37} The full-length CDS of *SjJAZ2/3/5/6/7* were
328 obtained from Osaka Prefecture University (kindly supported by Prof. Koh Aoki), and
329 was PCR-amplified and cloned into the pDONR221 vector (Invitrogen, CA, US) by using
330 BP reaction (Gateway[®]). Coding sequences of *SjJAZ1/4* were isolated from *Solanum*
331 cDNA using the primers. PCR-amplified *SjJAZ1/4* DNA was cloned into pENTR/D-
332 TOPO (Thermo Fisher Scientific, USA). Coding sequences of *SjJAZ8/9/10/11/13* were
333 synthesized by the manufacturers (Eurofins Genomics K.K., Japan), and were cloned into
334 the pDONR221 vector using the BP reaction. The CDS was then inserted into pEU-
335 FLAG-GW-STOP vector by using the LR reaction (Gateway[®]) to prepare the plasmid for
336 FLAG tag-fused *SjJAZ* (pEU-FLAG-GW-*SjJAZs*). These *SjJAZs* proteins were
337 expressed in wheat germ-derived cell-free protein expression system according to the
338 previous reports,³⁸ and used without purification. Cell-free translation reaction was
339 performed according to the instruction protocol (Cell Free Sciences, Co., Ltd., Ehime,
340 Japan) with minor modification. Briefly, the transcription reactions with pEU-FLAG-
341 GW-*SjJAZs* (each 1 µg) were performed at 37 °C for 5 h. The obtained mixture of mRNA
342 was added to creatine kinase and WEPRO7240 solution to prepare the translation mixture,
343 and it was carefully transferred to the bottom of a well containing translation buffer to
344 form the bilayer reaction, and then incubated at 15 °C for 20 h in 96 wells plate. The
345 obtained protein mixture was centrifuged (20,000 g for 15 min at 4 °C) and the supernatant
346 was used for the pulldown experiments without any purification.

347

348 **Synthesis of Fl-*SjJAZPs***

349 All *SIJAZ* peptides were prepared by microwave-assisted solid phase synthesis with
350 Fmoc-Tyr-Wang resin (90 μm) using Initiator+ Alstra (Biotage Ltd, North Carolina, US)
351 as previously reported with minor modification.³⁴ A representative protocol is as follows.
352 The resin was swollen in DMF at 70°C for 20 min. The Fmoc protecting group was
353 removed by treating with 20% piperidine in DMF twice. Amino acid coupling was
354 accomplished by mixing the resin with Fmoc protected amino acids (3 eq), *O*-(*1H*-
355 Benzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate (HBTU, 3 eq), 1-
356 Hydroxy-*1H*-benzotriazole hydrate (HOBt•H₂O) (3 eq), and DIPEA (6 eq) in DMF, and
357 subjecting it to microwave irradiation at 50°C for either 30 min (Fmoc-Arg-OH) or 10
358 min (others except for Fmoc-Arg-OH). After the peptide had been fully elongated, solid
359 phase-peptide was mixed with 5-carboxy- fluorescein diacetate (3 eq), HBTU (5 eq) and
360 DIPEA (5 eq) in DMF and incubated at r.t. for 2 h. After the reaction, the peptide was
361 deprotected by stirring using TFA solution at r.t. for 1.5 h (in cases of *SIJAZ*6 or 7,
362 deprotection was performed with TFA solution containing thioanisole, anisole and 1,2-
363 ethanedithiol for the avoidance of methionine oxidation). The reaction mixture was
364 purified by HPLC using a Develosil ODS-HG-5 column (Φ 4.6×250 mm) eluting with a
365 linear gradient (CH₃CN (0.05% TFA):H₂O (0.05% TFA) = 20:80 (5 min) to 50:50 (35
366 min)) to afford fluorescein-conjugated *SIJAZ* peptide. After lyophilization, conjugated
367 *SIJAZ* peptide was dissolved in sterilized water to prepare the stock solution. The
368 concentrations of the stock solution were determined by their absorbance at 494 nm in
369 0.1 N NaOH aqueous solution using a molar extinction coefficient of 75,000 M⁻¹ cm⁻¹.
370 The purity of each peptide was confirmed by HPLC analyses, and these were
371 characterized by MALDI-TOF MS as follows;

372 Fl-*SIJAZ*1: m/z [M+H]⁺ calcd for 3571.92, found 3571.92

373 Fl-*SIJAZ*2: m/z [M+H]⁺ calcd for 3573.86, found 3573.86

374 Fl-*SIJAZ*3: m/z [M+H]⁺ calcd for 3623.92, found 3623.90

375 Fl-*SIJAZ*4: m/z [M+H]⁺ calcd for 3651.85, found 3651.85

376 Fl-*SIJAZ*5: m/z [M+H]⁺ calcd for 3429.81, found 3429.80

377 Fl-*SIJAZ*6: m/z [M+H]⁺ calcd for 3500.83, found 3500.83

378 Fl-*SIJAZ*7: m/z [M+H]⁺ calcd for 3594.97, found 3594.99

379 Fl-*SIJAZ*8: m/z [M+H]⁺ calcd for 3443.80, found 3443.76

380 Fl-*SIJAZ*9: m/z [M+H]⁺ calcd for 3515.88, found 3515.84

381 F1-SIJAZ10: m/z [M+H]⁺ calcd for 3656.97, found 3656.99
382 F1-SIJAZ11: m/z [M+H]⁺ calcd for 3605.90, found 3605.89
383 F1-SIJAZ13: m/z [M+H]⁺ calcd for 3729.97, found 3729.98
384 F1-SIJAZ1/2/4-5: m/z [M+H]⁺ calcd for 3500.87, found 3500.84
385 F1-SIJAZ1-3DOD: m/z [M+H]⁺ calcd for 3623.92, found 3623.93
386 F1-SIJAZ1-4DOD: m/z [M+H]⁺ calcd for 3649.93, found 3649.92
387 F1-SIJAZ2-5DOD: m/z [M+H]⁺ calcd for 3500.84, found 3500.84
388 F1-SIJAZ5-2DOD: m/z [M+H]⁺ calcd for 3502.82, found 3502.82
389 F1-SIJAZ2-5: m/z [M+H]⁺ calcd for 3429.81, found 3429.80
390 F1-SIJAZ5-2: m/z [M+H]⁺ calcd for 3573.86, found 3573.87

391

392 **Pulldown assay**

393 All chemicals (JA-Ile or COR) were dissolved in ethanol to generate 10 mM
394 stock solutions and diluted with 20% ethanol aq. for preparation of 100 μM stock
395 solutions. For the pull-down experiments using full-length *SIJAZ* proteins, purified GST-
396 COI1 (5 nM), FLAG-tagged *SIJAZ* (each 20 μL of the translation mixture), and the
397 ligands (COR or JA-Ile) in 350 μL of incubation buffer (50 mM Tris-HCl buffer, pH 7.8,
398 100 mM NaCl, 20 mM 2-mercaptoethanol, 10% glycerol, 0.1% Tween20, 100 nM
399 inositol-1,2,4,5,6-pentakisphosphate (IP5)) were combined with anti-FLAG antibody
400 (0.2 μL, Sigma Aldrich, F1804, clone M2), and incubated for 10–15 h at 4°C with rotation.
401 After incubation, the samples were combined with SureBeads™ Protein G (10 μL in 50%
402 incubation buffer slurry, Bio-Rad). After 3 h incubation at 4°C with rotation, the samples
403 were washed three times with 350 μL of fresh incubation buffer. The washed beads were
404 resuspended in 35 μL of SDS-PAGE loading buffer containing dithiothreitol (DTT, 100
405 mM). After heating for 10 min at 60 °C, the samples were subjected to SDS-PAGE and
406 analyzed by western blotting. The bound GST-COI1 protein was detected using anti-GST
407 HRP conjugate (RPN1236, GE Healthcare, 5,000-fold dilution in blocking buffer
408 (Nakalai tesque, Inc., Japan)). FLAG-JAZ proteins were detected using anti-FLAG
409 antibody (1,000-fold dilution in blocking buffer) and anti-mouse IgG-HRP antibody
410 (Southern Biotech. Inc., Birmingham, US, 1031-05, 20,000-fold dilution in blocking
411 buffer). Three independent replicates were done with similar results.

412 For the pull-down experiments using fluorescein-tagged *SIJAZ* peptides (F1-

413 *S/JAZps*), purified GST-COII (5 nM), Fl-*S/JAZp* (10 nM), and JA-Ile (1 μ M) in 350 μ L
414 of incubation buffer were combined with anti-fluorescein antibody (0.2 μ L, GeneTex,
415 CA, US), and incubated for 10–15 h at 4°C with rotation. After incubation, the samples
416 were combined with SureBeads™ Protein G (10 μ L in 50% incubation buffer slurry, Bio-
417 Rad). The washing and eluting protocols were same as the pulldown experiments using
418 full-length JAZ proteins. Three independent replicates were done with similar results.

419

420 **AlphaScreen Assay**

421 AlphaScreen experiments were performed at 25 °C in the incubation buffer. 15 μ L
422 of the reaction mixture containing the incubation buffer, 5 nM *S/COII*, 10 nM Fl-*S/JAZps*
423 and various concentrations of COR or JA-Ile was added to a 1/2 Area AlphaPlate™-96
424 (PerkinElmer), and then incubated for 1 h at 4°C. Then, 10 μ L of a detection mixture
425 containing incubation buffer, 0.1 μ L of FITC-coated donor beads, 0.1 μ L of GST-coated
426 acceptor beads was added to each well. Finally, the mixture was incubated for 12 h and
427 the luminescence signals were detected using the Envision 2105 Multimode Plate Reader
428 (PerkinElmer). The experiment was repeated three times, and the data are presented as
429 average values with standard deviation.

430

431 ***In silico* analyses**

432 The homology modeling of *S/COII* was obtained based on the crystal structure of
433 *AtCOII*-JA-Ile-*AtJAZ1* (PDB ID: 3OGL). The structure preparation program in MOE
434 2020.09 was used to deduce the structures of the absent residues (residues 550–562) of
435 *AtCOII*. The model structures of *S/JAZ1*, and 5 were constructed by mutating residues of
436 the *AtJAZ1* peptide of the complex.

437 The MD simulations of the *S/COII*-JA-Ile-*S/JAZ1* and the *S/COII*-JA-Ile-*S/JAZ5* were
438 performed under the constant temperature and pressure ($T = 300$ K, $P = 1$ atm) condition.
439 The Parrinello-Rahman type thermostat [Parrinello, M. & Rahman, A. Polymorphic
440 transitions in single crystals: A new molecular dynamics method. Journal of Applied
441 Physics 52, 7182-7190 (1981).] and the Nosé-Hoover barostat [Hoover, W.G. Canonical
442 dynamics: Equilibrium phase-space distributions. Physical Review A 31, 1695-1697
443 (1985).] were adopted to control the system temperature and pressure, respectively. The
444 Amber14SB [James A. Maier, Carmenza Martinez, Koushik Kasavajhala, Lauren

445 Wickstrom, Kevin E. Hauser, and Carlos Simmerling, “ff14SB: Improving the Accuracy
446 of Protein Side Chain and Backbone Parameters from ff99SB”, J. Chem. Theory Comput.
447 2015, 11, 8, 3696–3713] and the generalized amber force field (gaff) [Junmei, W., M.,
448 W.R., W., C.J., A., K.P. & A., C.D. Development and testing of a general amber force
449 field. Journal of Computational Chemistry 25, 1157-1174 (2004)] were assigned for the
450 protein/peptide and the ligand molecule, respectively. The TIP3P model [Jorgensen, W.L.,
451 Chandrasekhar, J., Madura, J.D., Impey, R.W. & Klein, M.L. Comparison of simple
452 potential functions for simulating liquid water. The Journal of Chemical Physics 79, 926-
453 935 (1983).] was used for water solvent. The cutoff length for van der Waals (vdW) and
454 coulomb interactions in real space was 12 Å. The particle mesh Ewald (PME) method
455 [Darden, T., York, D. & Pedersen, L. Particle mesh Ewald: An N·log(N) method for
456 Ewald sums in large systems. The Journal of Chemical Physics 98, 10089-10092 (1993).]
457 was used for the estimation of the coulomb interactions. The time step for integration of
458 equations of motions was 2 fs. All MD calculations were done by GROMACS2018
459 program [M.J. Abraham, T. Murtola, R. Schulz, S. Pall, J.C. Smith, B. Hess, E. Lindahl,
460 GROMACS: High performance molecular simulations through multi-level parallelism
461 from laptops to supercomputers, SoftwareX 1, 19-25 (2015)].

462 The snapshot structures of the *S/COI1-JA-Ile-S/JAZ1* and *S/COI1-JA-Ile-S/JAZ5*
463 were sampled every 10 ps. We first performed 10 ns MD simulations for energy
464 minimization/equilibration of the systems and then conducted five independent 100 ns
465 MD simulations (total 500 ns) for each system. The system equilibrations of the
466 protein/peptide and the ligand were monitored by the root means square displacement
467 (RMSD) values as the simulation time step. We confirmed that the ligand binding modes
468 were not largely changed in all MD simulations. The last snapshot structures were used
469 as the representative structures to investigate the binding forms of the complex.

470

471 **Acknowledgement**

472 This work was financially supported by a Grant-in-Aid for Scientific Research from JSPS,
473 Japan (nos. 17H06407, 18KK0162, and 20H00402 for MU, nos. 18H02101 and
474 19H05283 for YT, and nos. 19K05378 and 20H04791 for HS), JSPS A3 Foresight
475 Program (MU), and JSPS Core-to-Core Program Asian Chemical Biology Initiative (MU).

476 And we also thank to Mr. Teppei Kamimura for his technical help. The computations in
477 this study were performed using the Advanced Center for Computing and Communication
478 of RIKEN, Research Center for Computational Science of Institute for Molecular Science
479 (IMS), Research Center for Advanced Computing Infrastructure of Japan Advanced
480 Institute of Science and Technology (JAIST).

481

482 **Author contribution**

483 M.U. conceived, designed, and coordinated the research project. M.U., Y.T., R.S., K.H.,
484 and H.S. designed the experiments and examined data. R.S., K.H., M.N., H.N., S.Y., and
485 T.M. performed the wet experiments. H.S., Y.T., and K.H. performed *in silico* studies.
486 M.U., Y.T., K.H., and R.S. wrote the main manuscript text and all figures. All authors
487 reviewed the manuscript.
