Version of Record: A version of this preprint was published at BMC Health Services Research on January 7th, 2022. See the published version at <https://doi.org/10.1186/s12913-021-07401-4>.

Abstract

Background: Political and managerial reforms affect the health sector by translating into governance tensions. As identified in the public management literature, they come from the diffusion of management principles and practices from the business world. They manifest at four levels: institutional, organisational, managerial and instrumental. The objective of this research is to understand how these tensions express healthcare institutions with different status.

Methods: We conduct a contrasting case study exploring the cases of two French healthcare institutions, one private for-profit (clinic) and one public not-for-profit (cancer treatment centre). Our analyses are mainly based on the content analysis of 32 semi-structured interviews conducted with staff (nurses, doctors, management and administrative staff) of these two institutions.

Results: Our results show that these tensions can be distinguished into three categories (tensions on professional values, standards and practices) which are expressed differently depending on the type of healthcare institution and its main management characteristics.

Conclusions: Unexpectedly, in the for-profit institution, the most intense tensions concern professional standards, whereas they concern professional practices in the not-for-profit institution. These analyses can help guide policy makers and health care managers to better integrate these tensions into their political and managerial decisions.

Introduction

In OECD countries since the early 1970s, political, administrative and economic reform programmes have been underway and some of them are leading to major changes in implementation of public policies. They are generating particularly acute tensions among the employees and managers of the public services concerned [1, 2].

These tensions result from the coexistence of opposing demands, or dualities, such as flexibility and control, differentiation and integration, stability and change [3]. Seen in isolation, each element in tension makes perfect sense, but when both elements appear at the same time, their coexistence may seem illogical. However, the two elements are indivisibly interconnected and interdependent [3].

As current events show, medical and nursing staff working in French health institutions are particularly affected by these tensions [4]. The number of demonstrations, the nature of the demands expressed, the motivations and the violence observed over the last few years reveal the seriousness of these tensions, which have increased over the last few years in French and European public and private healthcare institutions [4]. These tensions have become even more evident in recent months with the global health crisis caused by Covid-19 [5].

The main changes that occurred, enacted in regulations and laws, concern the policy, organisation and functioning of healthcare institutions in France [6]. The increase in the number of patients to care for, the complexity of the cases to be handled due to the ageing of the population, the development of chronic diseases, more and more expensive equipment and an unfavourable medical and nursing demography led to an increase in expenditure, a need to control resources and an overloading of physicians and nursing staff [7].

Hospital reforms have often aimed to improve collaboration and coordination between hospitals as well as access, quality and continuity of care [8]. However, these changes have been accompanied by protests and resistance against the various reforms [9–11], particularly in France, over the last 20 years [4]. The practices that result from these reforms, which according to health professionals are rooted in values from the market sphere [12], sometimes appear incompatible with the public service mission of healthcare institutions [13]. Nunes et al. [3] in analysing their causes, have shown that these incompatibilities are expressed in the form of dualities requiring meta-capabilities to manage them (Plural consensus, orchestrated emergence, distributed connectedness, patient coreness, formalized fluidity, cautious generativeness). However, beyond an analysis of their causes, these incompatibilities can also be analysed through their consequences on the personnel and production of health services. Indeed, they have ethical, organisational and managerial consequences [14] that we propose to examine through the prism of governance tensions. This analytical framework, widely tested in public management [15], offers the advantage of accurately identifying the effects of public reforms at four levels (institutional, organisational, managerial and instrumental) [16]. The research question we are addressing here is: in the context of political and managerial reforms in health, are governance tensions expressed in healthcare institutions in any way? Can we identify differences in their manifestation according to the status of the institution?

Using the analytical framework of public governance tensions [16, 17], we explore the case of two French institutions, a private for-profit one (clinic) and a public service not-for-profit one (cancer treatment centre). Our results allow us to identify three categories of tensions (on values, norms and professional practices) expressed with different intensities in the two institutions studied. These results guide health care decision-makers and managers towards taking these tensions more accurately into account in their political and managerial decisions.

Background

Conceptual framework of the study: Public Governance Tensions (PGTs)

Conceptual approaches that focus on tensions within national organisations and governance systems offer very interesting analytical potential for the management of public organisations [18] [19] and particularly that of healthcare institutions [20]. Tensions arise from incompatibilities or divergences in orientations and actions between, on the one side, a context shaped by challenges, actor dynamics and

specific rules [21] and, on the other side, an organisational environment characterised by its constitutional mission, its governance framework, its structures, its objectives, the status of its staff and the evolution of its management mode [22]. These tensions are expressed externally between the local and central levels of health systems [23, 24]. They are also expressed internally, as close as possible to the health professionals [9]. Thomson, Murtagh, & Khaw [9] have highlighted the importance of tensions between health policy objectives and the missions of health professionals and now encourage further study of these tensions. Since the late 1990s, reforms applied to public health organisations have led to significant changes in national systems of public governance [2] that affect organisations at four levels: public values, the architecture of organizational structures, formal management frameworks and management instruments [16] (Fig. 1).

Exploring the effects of reforms (notably, the LOLF in France and the LAP in Quebec), Hudon and Mazouz [17] identify four categories of tensions on the roles, functions and responsibilities of public managers: ethical tensions, organisational tensions, managerial tensions and artefactual tensions (Fig. 1).

- Ethical tensions arise from the difficulty of making the public service mission possible to coexist with increased public performance as considered by the institutional promoters of NPM [26]. It leads to a re-examination of the ethics of staff and public agents [27, 28].
- Organisational tensions can be caused by the reorganisation of work, the reconfiguration of hierarchical relationships, coordination mechanisms or the allocation of resources [29, 30].
- Managerial tension is a consequence of the evolution of official administrative frameworks (e.g. activity-based financing) in France [31]. It is perceived at the implementation level of the law and administrative rules that lead to tensions between different public professions [32].
- Artefactual tension refers to the instrumental level (or management tools). It arises from the difficulty of matching instruments focused on measuring and evaluating results (the managerial logic) with instruments derived from a bureaucratic logic that focuses on the regulation of rules and means [2, 22, 33].

The interest of applying this framework of analysis of PGTs in health organisations lies in its capacity to illustrate tensions by their consequences, which are often more easily perceived and expressed by health professionals. The application of this framework therefore complements the work that focuses on the causes of tensions [3], with a view to possibly combining these two approaches in future work.

Methods

The methodology used is that of a contrasting case study. It is consistent with the replicative research strategy recommended by Yin [34]. The operational approach consists of using the same conceptual and theoretical framework to study one case, then another or others. This approach has the advantage of strengthening the external validity of the knowledge produced in a qualitative approach [34]. It is

particularly suitable for studying organisational change [35] experienced by healthcare institutions over the last two decades.

Presentation of the two cases studied

In France, there are three types of healthcare institutions:

- Public health institutions (1,389 institutions in 2019 [36]). These are legal persons under public law with administrative and financial autonomy. They are subject to State control. Their main vocation is neither industrial nor commercial. These university hospital centres are involved in both medical and pharmaceutical research and medical and paramedical education.
- Private not-for-profit establishments (689 institutions in 2019), generally from religious, charitable or mutualist movements. These are private health establishments. They are qualified as being of collective interest as long as they provide a public hospital service.
- Private for-profit institutions (1,014 institutions in 2019). These are private clinics with a health and commercial vocation managed by private funds and management. Nevertheless, they have a close link with public reforms and policies, since Public Social Security reimbursements represent more than 60% of their revenues in 2020 [36].

We have chosen two cases to reflect the particularities of French private health institutions, a clinic and a cancer treatment centre (in French *Centre de Lutte Contre le Cancer* - CLCC), both located in the same region of France (Table 1).

The choice of these two establishments is dictated by contrasting contextual and organisational considerations. These two structures are private and operate in the same health context (public mission but pursuing different profit and not-for-profit objectives). One is located in a major metropolis, which can facilitate the professional mobility of the staff of these institutions. The staff have many public and private health establishments nearby to carry out their activities, unlike the city in which the clinic is located. This one is characterised by a more limited supply of health services, which is a limit to the professional mobility of staff in this area. The two institutions are 70 kilometres apart.

Method of data collection

We conducted a series of semi-structured individual interviews with 32 healthcare personnel from two French hospitals of different status (clinic and CLCC). All methods were carried out in accordance with relevant guidelines and regulations. The interviews are part of a written research process built in strict compliance with the rules of the ethical charter of the university research laboratory of the authors of the study. The interviews were conducted with the agreement of the management of the two institutions studied and approved by their boards of directors. The experimental protocol used was brought to the attention of the ethics committees of the two institutions studied. The selection of interviewees was made on a voluntary basis from a mailing designed and sent by the management of the two institutions

studied. Our research is a non-interventional research so it is not subject to the rules of the French Jardé law (law n° 2012 – 300, 2012 March 5th). This category of research based on the collection of individual representations doesn't need a written consent. However, before collecting the discourse of our interviewees for each of them we have detailed our research objective and methodology (objective, how we use and analyse data, principle of anonymised data). We obtained and audio-recorded oral informed consent from each respondent.

Three main categories of staff were investigated: doctors, nursing staff and staff with managerial functions (coordination, steering, administrative) (Table 2). The interview guide is structured around four themes: the work environment and its evolution, the organisational, professional and personal values, the tensions felt or perceived, and the meaning given to work. After obtaining the consent of each interviewee for the recording and transcription of their speech, we transcribed and analysed the 1,293 minutes of recorded interviews.

Method of data coding

Based on the conceptual framework of PGTs [16, 17], we constructed an analysis grid adapted to our research question. This allowed us to code our materials (Table 3) in order to identify and characterise the tensions of public governance present in the two institutions studied.

Results

Our results highlight the presence of governance tensions at four levels. However, these tensions manifest differently depending on the characteristics of the healthcare institutions.

Ethical tensions and changing institutional values

In the two establishments studied, we identify ethical tensions linked to the questioning of the weight of financial constraints, economic viability and compatibility with the public care mission. The staff are aware of their representations, which are strongly anchored in the values of care. These values are at the very heart of the health professions. Thus, achieving a different meaning requires deconstructing the representations according to which good care is not compatible with a strong focus on the financial dimension.

"We have common representations, common values such as "yes, we provide better care in the public sector than in the private sector where profitability and medicine do not mix" lb11.

These representations largely explain the ethical tensions felt when the term profitability is introduced in the managers' speeches and activity reports. Nevertheless, these ethical tensions are expressed somewhat differently for CLCC staff and clinic staff.

In the clinic, the financial dimension is an important issue and a question of the sustainability of its activity, but it is rather well accepted. Managers explain the need to reconcile care and financial

performance to ensure the clinic's survival. The staff integrate these values while ensuring their compatibility with the public mission of "care".

"We are asked to do this or that, to review the way we work with patients. I think it's essential to have these management tools to be able to explain to the teams why we do this. We can't say that we have pressure on the results, but we are aware of what is at stake and what the clinic has to do to exist." 1a9

The professional practices and behaviours of the staff make it possible to reconcile the imperatives of patient care with a rational use of resources.

"I am quite flexible as long as their work is done, ... mutual trust." 1a3

For the clinic's physicians, *"profitability depends on the best possible quality of care. It is not an end in itself"* 1b7.

At the CLCC, the values of care prevail over managerial values in this construction. Practices and behaviours are part of a setting where economic performance is very present, but in the minds of the interviewees, the values of the public service mission predominate.

"The advantage of a CLCC is that the management is entrusted to a doctor, unlike a university hospital. Production, which is care, is then at the origin of the strategic factory, how to provide better care and not exclusively, how to increase the volume of activity." 1b17.

Although the idea of profitability is very much present in the CLCCs' general management, for them, profitability must be at the service of patients and aims to maintain and perpetuate the medical and care offer.

"The public service character is linked to the fact that we are financed by public money. So in this context, because of our mission of collective interest, the profit must not be excessive" 1b14.

Thus, at the CLCC, the responses we obtained clearly highlight the values of care as unquestionably dominating those of management.

Organisational tensions generated by the diversity of professional standards

The staff of both establishments report a significant change in working practices.

In the care professions, managers and nursing staff note an increasing emphasis on "technical care" to the detriment of "relational care". They seem to regret it but they understand it.

"We are arriving at a new type of care which, in my opinion, has become much more technical, standardised, classified and normalised." 1b13

Professional competence is now anchored in a technical skill that is guided by the application of rules and procedures that some find comfortable. These provide a reassuring framework for the exercise, it is that of correct technical gestures and of the control associated with them.

"Confidence is built on technical skills but also on the attitude we have towards the patient. The patient needs rigour and humanity" lb1.

In the clinic, the professional standards that guide the activity of each category of staff are generally accepted. The compatibility of personal values with professional standards depends on the acceptance of the system and the tools for steering the activity.

"Management tools make it easier to accept... heads of department are now able to anticipate whether they are actually going to replace a person or not... they say to themselves 'I'm going to have heavy patients now, I absolutely have to take on an extra person without being afraid of being reprimanded because there is a justification'. "la2

In this constrained framework (compliance with administrative-financial standards), the respondents underline the challenge they face in reconciling profitability with the best possible care of the patient.

"Yes, profitability is a concern, there may be a temptation to buy cheaper medical devices, but you have to keep in mind that it is the patients who are behind it. Balancing the two is a challenge for me. "la4

It seems that all the staff internalise this meaning. Nevertheless, for some of the interviewees, their work is more a manifestation of submission to authority than a true adherence to this meaning.

"The management makes us feel that we have to be profitable, whereas for us the human side is more important. It's true that there are tensions at that level."la1

For both hospitals, professionalism is expressed in a high level of demands on patients. This is particularly prevalent in discourses for the CLCC where care is particularly complex. This very strong requirement expresses a very pronounced professional commitment.

We have to be careful to live up to our reputation, not to disappoint. "lb4

"You don't become a carer like you become a mechanic, you have to take care of your patients, you have to relieve them, you are a carer" lb4.

The regulation of organisational tensions is achieved through a stronger focus on professional practices and on patient care rather than on technical standards, although these remain important.

Managerial tensions between practices and professional standards

Within healthcare institutions, cooperation with other professionals and institutions is seen as helping to reduce the risk of tensions on professional practices that the managerial practices of the NPM [37] may cause.

However, managerial tensions may persist because, according to the interviewees, in a context of competition, private and public health institutions are seeking to gain patients and market share. This situation leads to limited collaborations that most of them regret.

"We are in direct opposition to the public and private sectors, but we defend the patient's pathway. In all cases, the patient goes to the clinic, to the university hospital, comes back to the CLCC." Ib1

In the face of managerial tensions between intra- and inter-organisational professional practices, teamwork takes on its full meaning.

This is particularly true in the CLCC, because the team plays the role of regulating professional tension by making it possible to objectify a situation and thus to restore value and meaning at work.

"In the oncology sector, there are very strong friendships that develop because there are difficult situations to live through and this is part of the life of the institutions. There are human stories. "« ... ». The team is a valve when we are experiencing a difficult situation in our workplace, the informal exchange times we used to have with the other people in the team allowed us to regulate, but today, the reorganisation of the work has reduced these spaces that allowed us to talk about our ethical questions" Ib1.

Cooperation with the patient also makes it possible to align the practices of the CLCC's health professionals. The attention paid to the patient as a person and his or her well-being unites the professionals despite the tensions.

"Professionals who remain on the "I know" perspective for the patient and others who have understood that the patient has much to teach us" Ib1.

On the other hand, for the professionals in the clinic, cooperation is not spontaneously mentioned as a deliberate practice. It is rather a response to a normative injunction, to a standard that is prescribed by the management. The staff mentioned the difficulty of cooperating with other structures, the reason being the existence of a form of hidden competition (capturing more patients than the "competitor"). This posture nevertheless questions the health and care professionals who are more naturally inclined to cooperate for the benefit of the patient.

"Cooperating would have made sense for all of us. They refused, they were afraid. We will still manage without them, but it's sad". Ia4.

Instrumental tensions modifying professional practices and behaviour

Many professional practices of healthcare staff have had to change as a result of the reforms that have affected healthcare establishments in France since the early 2000s (introduction of activity-based pricing in 2004, the HPST law in 2009, "*Ma santé 2022*", a law enacted in 2019). These reforms have largely contributed to the development of management tools and indicators in the daily work in all its aspects of health personnel (hospital staff, nurses, care assistants, managers, physicians) [38].

In the clinic studied, managers use these indicators and management tools to translate management's orientations to the healthcare teams in order to reduce tensions between professional practices and management standards.

"You have to be profitable despite everything, while ensuring quality. The quality of care is paramount. But the staffing indicators in my department also allow me to say to management, below that, you can't do less, we won't go below that staffing level, it's not possible" 1a5.

Within the CLCC, there is a great need to understand the meaning of management tools and indicators. There is a real questioning about the relevance of the tool but also over its ability to report on situations.

"We have to change our indicators completely because they are obsolete, we have to adapt them to changes. I am told that there is an increase in expenditure in my department, whereas we have played the game and made savings. I am being charged for expenses that are made by the anaesthetists and over which I have no control." 1b9.

It is up to the CLCC managers to deal with the tensions generated by the financial dimension, which is becoming more and more prevalent. It is their challenge to reconcile management tools with the professional practices of medical and nursing staff. This is a delicate exercise that causes for some of them discomfort, but it is accepted and generally perceived as a necessary challenge to be met.

"We need to increase activity, when I say that to the nurses, it's still disturbing. But I'm fully aware that I have to talk about money in my job. But it's also a challenge to my way of looking at things" 1b4

Discussion

Three forms of tension, mainly professional

Our results show that the tensions of public governance are clearly present [16, 17] in healthcare institutions [9, 22]. However, it is not the protests and resistance [9] that emerge from the discourses, but the ability of staff to deal with these tensions and make them liveable or even acceptable [39].

The tensions observed concern the four levels of governance (institutional, organisational, managerial and instrumental). The responses made by staff to manage them are strongly influenced by the context in which their institution operates (Table 4). Our study highlights three main categories of governance tensions that are expressed primarily at a professional level in healthcare organisations: tensions concerning professional values, standards and practices (Table 4). First, the tensions on professional

values, observed in the two hospitals studied, come from the difficult reconciliation of financial values, particularly those resulting from the hospital reforms of the last 30 years, with the traditional values of care carried by the health professionals. Tensions regarding professional standards result from the evolution of medical and nursing work towards technical dimensions to the detriment of its relational dimensions between health professionals or with patients. Lastly, tensions on professional practices stem from the development of management tools in healthcare institutions (generalisation of activity-based pricing, development of cost calculation tools, reporting to regional health agencies). These are gradually replacing the managerial practices that until now have been mainly oriented towards the management and steering of care functions (Table 4).

However, these three categories of tension are expressed differently depending on the type of institution and, in particular, its main management characteristics.

In the private for-profit clinic, contrary to all expectations, the analysis of the verbatim reports reveals that tensions related to professional standards are the most important. The clinic staff were able to address these tensions (Table 4). In the interviews, they emphasized the pre-eminence of technical work standards and procedures in their work and the delicate reconciliation with the relational dimension of their work. This is evidence that these tensions are present and that they guide the ways in which staff act. The staff of the establishment mentioned tensions concerning professional values and practices, but in a much less marked way.

On the contrary, in the not-for-profit public service CLCC, it is mainly tensions on professional practices and, to a lesser extent, tensions over professional values that the staff are required to respond to (Table 4). For these staff, the main tensions arise from the difficult cohabitation between the management tools accompanying public reforms in French healthcare institutions and the care functions attached to the profession of care provider. To a lesser degree, related tensions are expressed between the care values of the staff and the financial values of the reforms.

The identification of these three forms of tension and their modes of expression in two types of health establishments makes it possible to understand and anticipate the forms of appropriation of health policies in care organisations.

In conceptual terms, by analysing the consequences of tensions at four levels (institutional, organisational, managerial and instrumental) (Table 4), the conceptual framework mobilised and our analytical work make it possible to identify tensions arising from the activity of health professionals. By studying the consequences of tensions on professional activity, this analysis completes the one carried out on the causes of tensions [3] which focuses on the managerial tensions of a specific activity (quality management, information management, financial management, etc.). It shows that alongside the tensions caused by each managerial "object", there are also more systemic tensions generated by the overall governance of the health system and the political reforms that are particularly important in France.

In practical terms, national policy makers and managers in institutions need to identify and discuss good practice in order to design and implement successful health reforms [7]. Our results demonstrate the need to also integrate an analysis of the risks of professional tensions related to political and managerial decisions in order to build health policies adapted to their implementation context.

Different intensities of professional tensions according to the type of healthcare organisation

From a theoretical but also practical point of view, this study allows us to propose a precise distinction between the forms and intensity of governance tensions in health organisations (Table 5).

Against all expectations, in the for-profit organisation, which is apparently a less bureaucratic organisation, it appears paradoxically that it is the professional standards (procedures and work standards) that can be the most disruptive for the staff (Table 5). Performance objectives (economic or service quality) and reporting procedures come into strong tension with the relational dimensions of care functions. However, it is also in the face of these tensions that health professionals find the most adaptation, notably by orienting these standards towards patient care. The resolution or at least the reduction of these tensions is more regularly sought through the construction of new professional standards articulated mainly around the patient and his/her care.

Tensions on professional values and practices also exist in these organisations but are more moderate. They seem to stem from professional tensions over standards, especially when they require a practical or value-based translation of prescribed procedures.

In the not-for-profit organisation, which might on the contrary appear more bureaucratic, it is the professional practices that are the source of tensions, particularly when they neglect the relational dimensions of care work (Table 5). These tensions in professional practices are most clearly linked to the difficult reconciliation between the technical dimensions of care work (medical and organisational dimensions of care) and the relational dimensions. The resolution or at least the reduction of these tensions is sought through greater intra- and inter-organisational cooperation between health professionals. In this case, public reforms or managerial decisions concerning the necessary improvement of medical and organisational practices will be more easily prescribed by encouraging staff cooperation.

Tensions on values also exist but are less intense. They are often managed by a greater investment of staff and a gradual appropriation of the financial values of care by the values of care.

This distinction between the intensities of these three tensions in the two most traditional forms of health organisation (for-profit and not-for-profit) offers managers and public policy makers the opportunity to better understand or anticipate how their reforms or managerial decisions will influence the work of health professionals.

Contributions

This work on the modes of expression of governance tensions in health care institutions of different status presents three contributions, theoretical, methodological and managerial.

First, at the theoretical level, this study shows that these tensions are expressed mainly at the professional level, in three distinct areas: professional values, professional norms and professional practices. This result complements work on the tensions caused by public policy changes in the health sector [9, 20, 24]. It shows, on the one hand, that in this sector, these tensions are expressed in institutions mainly at the professional level and, on the other hand, that in addition to the analysis of their causes [3], these tensions are also observable through their consequences on the personnel. At the same time, this study also indicates that, in the private for-profit clinic, contrary to all expectations, tensions around professional norms appear with much greater intensity than those relating to professional values or practices. On the contrary, in the not-for-profit public service CLCC, it is mainly tensions relating to professional practices that dominate and to a lesser extent those relating to values.

Secondly, from a methodological point of view, this study has made it possible to construct an initial research method using the contrasting case study to study governance tensions in health care institutions. This method can be replicated and tested in future studies, particularly by studying other forms of contrast.

Finally, and thirdly, from a managerial point of view, the identification of these three categories of tensions in health care institutions offers health policy makers and health care institution managers the opportunity to identify how tensions develop in health care institutions and are managed by staff and managers. Addressing these tensions in the design and implementation of health policies is an important issue.

Limitations and future research

A first limitation of this study is related to the lack of exhaustiveness of our approach, which is limited to the study of two French healthcare institutions and does not allow us to take into account all the contextual specificities of governance tensions. A future step in this work is to carry out other comparative studies to support and enrich the categorization of tensions proposed in this study. A second methodological limitation concerns the selection of interviewees, which was done on a voluntary basis. Future studies will have to determine whether selection by sampling or randomization could modify the results obtained.

Conclusion

The purpose of this article was to better understand how governance tensions are expressed in healthcare institutions. The contrasting study of two healthcare organizations, one private and for-profit, the other public service and not-for-profit, allowed us to identify more precisely the characteristics of these tensions. This is a significant improvement in our knowledge of these tensions in health care organizations and how they are constructed. Future work already in progress should enable us, on the

one hand, to confirm the categorization of tensions put forward but also, on the other hand, to justify by other explanations their different modes of expression according to health care institutions.

Declarations

Ethics approval

The experimental protocol used was brought to the attention of the ethics committees of the two institutions studied (Centre Jean Perrin Clermont-Ferrand - France, Polyclinique La Pergola - Vichy - France). Our research is non-interventional and therefore not subject to the rules of the Jardé law (law n° 2012-300, March 5, 2012) on biomedical research conducted in France. This category of research based on the collection of individual representations of health facility staff does not require written consent by it just requires information of the ethical committees of the two institutions, which was carried out.

Concerning the protection of personal data, in the European Union and in France, the General Data Protection Regulation (GDPR) (Regulation 2016/679 of the European Parliament and of the Council of 27 April 2016) came into force on 25 May 2018. The French Data Protection Act (Law No. 78-17 of January 6, 1978 on information technology, files and freedoms) has been adapted accordingly by the Personal Data Protection Act currently being enacted. These two texts now form the basis of the new regulation on personal data protection. The GDPR defines personal data as "any information relating to an identified or identifiable natural person", i.e. a natural person who can be identified, directly or indirectly. In practice, this may include identification data such as surname, first name, address or telephone number, information relating to the patient's personal life (e.g. number of children), social security coverage (e.g. compulsory health insurance, supplementary health insurance, etc.) and, above all, information relating to the patient's health (pathology, diagnosis, prescriptions, care, etc.), and any professionals involved in his or her care.

In our study, we do not use any of these data because they are only interview data with health care staff for which no identification of individuals is mentioned. The data used relate only to the individual perceptions of staff at the two health care facilities studied and do not present personal information about the respondents.

Consent to participate

Oral informed consent was obtained from all participants at the beginning of each interview and recorded. Each participant also verbally consented to the audio phonic recording of the interview. The interviews were conducted with the agreement of the management of the two institutions studied. Permission to conduct the staff interviews was obtained directly from the chief executives of the two institutions studied in agreement with their boards of directors. The interviewees were interviewed on a voluntary basis.

Consent for publication

All authors have seen and approved the manuscript and contributed equally for the paper. They consent to the publication of this article if it is accepted.

Availability of data and materials

The datasets used and/or analyzed during the current study available from the corresponding author on reasonable request.

Competing interests

The authors report no conflict of interest

Funding

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Authors' contributions

L.M. presented the conceptual framework. C.R. presented the methodology. L.M and C.R. coded the results. C.R. extracted the results. L.M. and C.R. discussed the results and wrote the conclusion. L.M. and C.R. formatted the manuscript.

Acknowledgements

The authors of this article would like to warmly thank the management and staff of the CLCC Jean Perrin in Clermont-Ferrand (France) as well as those of the Polyclinique La Pergola in Vichy (France), for providing access to the data for this study.

Tables

Table 1. Two contrasting cases: CLCC (public mission) and clinic (private for-profit)

Contextual and organisational factors	CLCC	Clinic
Status	Private, but close to public structures such as university hospitals (care, research and teaching missions)	Private care mission
Connecting entity	Member establishments of <i>Unicancer</i> federation of 20 establishments	Establishment of the <i>Elsan</i> group which is the leading operator of private clinics in France
Location	Conurbation of of more than 290,000 inhabitants	Town of 25,000 inhabitants
Organisational specificity	Specialist in the management of cancerous pathologies Model of care for cancer patients	Multi-specialty community medicine and surgery
Number of related professionals	724 102 doctors	212 62 doctors and 150 non-medical staff (caretakers, administrative staff, ...)
Annual number of patients treated	32.000	8000

Table 2: Respondents in the two institutions

Clinic			CLCC		
Code	Function	Duration (min)	Code	Function	Duration (min)
Ia1	Care Assistant	42	Ib1	Director of Care	65
Ia2	Human Resources Manager	42	Ib2	Medical assistant	36
Ia3	Financial Manager	39	Ib3	Intensive Care Nurse	28
Ia4	Pharmacist	31	Ib4	Nurse	39
Ia5	Coordinating Officer	44	Ib5	Emergency Doctor	54
Ia6	Doctor	34	Ib6	Medical Secretary	39
Ia7	Anaesthesiologist	54	Ib7	Administrative logistical Manager	42
Ia8	Hospital Services Agent	32	Ib8	Medical Assistant	44
Ia9	Health care Manager	27	Ib9	Medical Secretary	37
Ia10	Care Assistant	29	Ib10	Surgeon	48
Ia11	Quality Engineer	44	Ib11	Computer Scientist	57
Ia12	Care Assistant	45	Ib12	Senior Health Executive	57
Ia13	Coordinating Manager	39	Ib13	Imaging Department Manager	51
Ia14	Executive secretary	33	Ib14	Deputy Director	73
Ia15	Nurse	24	Ib15	Doctor	38
Ia16	Nurse (surgery)	29	Ib16	Financial Affairs Director	39

Table 3. Interview coding grid

Levels of governance (Mazouz et al, 2012)	Governance tensions (Mazouz et al, 2012. Hudon and Mazouz, 2014)
Institutions (values, beliefs, cultures) Organisations (supply structures) Official management frameworks (laws, rules, procedures) Management tools (HRM, accounting, logistics tools, etc.)	Ethical tensions (in terms of values and standards) Organisational tensions (at the level of work organisation and coordination mechanisms) Managerial tensions (in the application of laws, rules and procedures) Artifactual tensions (at the level of management instruments)

Table 4. Governance tensions in healthcare institutions

Levels of governance	Clinic		CLCC	
	Governance tensions	Responses to tensions	Governance tensions	Responses to tensions
Institutional	Tensions on professional practices (management instrumentation vs. care functions)	- Role of middle managers in translating steering tools and their objectives	Tensions on professional practices (technical vs. relational dimension of work)	- Role of middle managers in mitigating tensions
	Tensions on professional standards (technical vs. relational dimension of work)	- Acceptance of the search for profitability in order to perpetuate the clinic and its place in the region	Tensions on professional values (care values versus financial values)	- Role of professional beliefs of health workers
Organisational	Tensions on professional standards	- Role of the patient pathway in professional cooperation and teamwork	Tensions on professional practices	- Enhanced cooperation between professionals to ensure both technical and relational functions of care
Managerial	Tensions on professional values	- Professional beliefs focused on patient care	Tensions on professional values	- Staff sacrifice and commitment to the care profession
	Tensions on professional standards	- Cooperation and teamwork encouraged by management		
Instrumental	Tensions on professional standards	- Role of higher pay for workers in the profit sector - Role of management indicators in negotiating with management	Tensions on professional practices	- Appropriation of management tools in the professional practices of the staff - Cooperation with health personnel outside the institution

Table 5. Forms and intensity of professional tensions in healthcare organisations

Intensity of tensions	Private for-profit healthcare organisation	Public not-for-profit healthcare organisation
Strong	Tensions on professional standards (between technical and relational dimension of work)	Tensions on professional practices (between technical and relational dimensions)
Moderate	- Tensions on professional values (between care values and financial values) - Tensions on professional practices (between technical and relational dimensions)	Tensions on professional values (between care values and financial values)
